Contents

Preface ix
About the Author xiii

Chapter 1 Introduction: Toolbox at the Physical–Life Science Interface 1

Chapter 2 Orientation for the Bio-Curious: The Basics of Biology for the Physical Scientist 13

Chapter 3 Making Light Work in Biology: Basic, Foundational Detection and Imaging Techniques Involving Ultraviolet, Visible, and Infrared Electromagnetic Radiation Interactions with Biological Matter 59

Chapter 4 Making Light Work Harder in Biology: Advanced, Frontier UV–VIS–IR Spectroscopy and Microscopy for Detection and Imaging 111

Chapter 5 Detection and Imaging Tools that Use Nonoptical Waves: Radio and Microwaves, Gamma and X-Rays, and Various High-Energy Particle Techniques 161

Chapter 6 Forces: Methods that Measure and/or Manipulate Biological Forces or Use Forces in Their Principal Mode of Operation on Biological Matter 203

Chapter 7 Complementary Experimental Tools: Valuable Experimental Methods that Complement Mainstream Research Biophysics Techniques 265

Chapter 8 Theoretical Biophysics: Computational Biophysical Tools and Methods that Require a Pencil and Paper 315

Chapter 9 Emerging Biophysics Techniques: An Outlook of the Future Landscape of Biophysics Tools 395

Index 435
