Preface ix
Acknowledgements xii
About the author xiii

1. Introduction 1
2. The physics of errors as illustrated by X-ray crystallography 6
   - 2.1 Random and systematic errors in X-ray crystallography 6
   - 2.2 The role of expertise and reproducibility 6
   - 2.3 Prior knowledge harnessed as model refinement restraints 7
   - 2.4 Standard uncertainty estimates 9
   - 2.5 How can X-ray crystallography make its results as close to truth as possible? 13
3. History of the reliability of structure determination methods 16
4. Mass spectrometry 23
   - 4.1 History 23
   - 4.2 Protein crystallography and the Matthews coefficient 24
   - 4.3 Mass spectrometry modern developments 24
5. Structure validation approaches 28
6. Other validation tools: Round-robin projects 33
7. Similarities and differences in the probes used in structure determination 39
   - 7.1 Sample scattering power 42
   - 7.2 The important role of nuclear magnetic resonance (NMR) 42
8. Fibre diffraction 49
9. Powder diffraction 53
10. Small-angle solution scattering 58
    - 10.1 Crustacyanin as a case study 61

11. Electron microscopy (EM) 67
11.1 Case study: A computational protocol to describe coordinate uncertainty and the density at each atom in cryoEM 69
11.2 Case study of inhibition of *M. tuberculosis* and human ATP synthase by BDQ and TBAJ-587 69
12. X-ray absorption spectroscopy (XAS) 73
12.1 Case study: Photosystem II 73
13. NMR 77
14. EPR for metalloproteins 82
15. Combining methods for accuracy 86
15.1 Combining X-ray crystallography then neutron crystallography 87
15.2 The case of malate synthase G studied by MX, NMR, SAXS, and cryoEM 88
15.3 Simultaneous measurements made from the same sample 92
16. Combining methods to span different length scales 96
17. Role of simulations of structural dynamics as a complement to experimental studies 102
17.1 Molecular dynamics 102
17.2 Molecular animations 104
18. Role of predictions as a grand challenge in biology: Protein fold prediction is solved 108
19. A new method: X-ray photon correlation spectroscopy (XPCS) to study biocondensed matter 111
20. Conclusions 113
21. Appendix A1: Bayesian reasoning in data analysis and model refinement 116
