Preface xi

1. The genetic basis of predation by myxobacteria **1**

Emily J. Radford and David E. Whitworth

1. The myxobacteria 2
   - 1.1 Myxobacterial diversity and distribution 2
   - 1.2 Myxobacterial multicellular behaviours 8
2. Myxobacterial predatory activity 13
   - 2.1 Prey range 13
   - 2.2 Contact-dependent killing 17
   - 2.3 Secreted factors 19
3. The genetic basis of predatory activity 24
   - 3.1 Molecular genetic studies 24
   - 3.2 'Omic studies 31
4. Applications in biological control 34
   - 4.1 Sectors 34
   - 4.2 Strains for biological control 37
5. Perspectives 42
   - 5.1 The role of models 42
   - 5.2 Evolve, engineer and/or select 43

References 44

2. Utilisation of low methane concentrations by methanotrophs **57**

Lian He and Mary E. Lidstrom

1. Introduction 58
2. Methane oxidation systems 60
   - 2.1 The known methane oxidation enzymes 60
   - 2.2 The pMMO 62
3. Possibility of a high affinity pMMO 63
   - 3.1 Environmental samples and pure cultures 63
   - 3.2 Whole cell methane consumption kinetics 64
   - 3.3 Summary: high affinity pMMO 79
4. Growth on low methane concentrations 80

4.1 Growth on 200–1000 ppm methane 80
4.2 Growth on 100 ppm and below methane 83
4.3 Summary: growth on low methane concentrations 85
5. Strategies for decreasing methane to slow global warming 86
6. Future Work 87
6.1 Isolation and characterisation of new aerobic methanotrophs 87
6.2 Adaptive laboratory evolution 88
6.3 MMO engineering 88
6.4 Methane utilisation in the environment 89
6.5 Engineered technology 89
7. Summary 90
References 90

3. The globins of cyanobacteria and green algae: An update 97

Juliette T.J. Lecomte and Eric A. Johnson

1. Introduction 98
1.1 Structural considerations 99
1.2 Chemical considerations 105
2. The haem-binding globins of cyanobacteria and green algae 108
2.1 Cyanobacterial haem-binding globins 109
2.2 Chlorophytic haem-binding globins 118
3. The linear tetrapyrrole-binding globins of cyanobacteria and algae 126
4. The RsbR-like proteins 128
5. Phylogeny of the five-branch globin superfamily 129
6. Applications 130
7. Concluding remarks 132
Acknowledgement 132
References 133

4. Role of sulfidogenic members of the gut microbiota in human disease 145

Andreia I. Pimenta, Raquel M. Bernardino, and Inês A.C. Pereira

1. The human gut microbiome 147
2. Diet and dysbiosis 150
3. Hydrogen sulfide in the gut 152
3.1 Endogenous H_2S production 153
3.2 Microbial H_2S production 153
3.3 Effects of H_2S 155
4. *Bilophila wadsworthia* 156

4.1 Energy metabolism 157
5. Sulfidogenic bacteria and disease 164
5.1 Diseases associated with intestinal bacterial overgrowth 165
5.2 Bacteremia and infection 179
6. Conclusions 182
Acknowledgments 183
References 183

5. *Staphylococcus aureus* response and adaptation to vancomycin **201**

Anaëlle Fait, Stephanie Fulaz Silva, Jack Åke Harry Abrahamsson, and Hanne Ingmer

1. Introduction 202
2. VISA and hVISA definitions 204
3. Clinical impact of VISA 205
4. Vancomycin mode of action and VISA phenotypes 215
5. Transient VISA 218
6. VISA mutations 219
7. Collateral susceptibility to antimicrobials 231
8. Collateral effects of VISA on phage susceptibility 236
9. Epistasis and stability 238
10. Perspectives 241
Acknowledgement 242
References 242
Further reading 258

6. The past, present and future of polymicrobial infection research: Modelling, eavesdropping, terraforming and other stories **259**

Éva Bernadett Bényei, Rahan Rudland Nazeer, Isabel Askenasy, Leonardo Mancini, Pok-Man Ho, Gordon A.C. Sivarajan, Jemima E.V. Swain, and Martin Welch

1. Introduction 260
1.1 Tapping into 'microbial dark matter' 262
1.2 The airway microbiota 263
1.3 The skin microbiota 268
2. Laboratory endeavours 270
2.1 Models for the study of polymicrobial infections 270
2.2 Models of CF lung microbiology 271
2.3 Chronic wound models 274

2.4 Ex vivo models 274
2.5 Invertebrate models 275
2.6 Vertebrate models 276
3. Imaging: direct observation and heterogeneity 277
4. The extracellular interactome: *P. aeruginosa* as micro-architect of the lung 278
5. Interspecies relations: social and antisocial microbes in infection 282
5.1 Bacterial interactions 282
5.2 Interkingdom interactions: bacteria and fungi 286
5.3 The diverse forms of interspecies communication 289
6. Understanding the ecology of inter-species interactions: computational approaches and perspectives 291
6.1 The joys and miseries of 'curated' databases 291
6.2 Mathematical models 292
6.3 The current state of the art: rethinking levels of organisation 294
7. Conclusions 296
Acknowledgements 296
References 296
