Contents

1 Life, Cells and Thermodynamics 1

1.1 The Origin of Life 2
1.1A Biological Molecules Arose from Inanimate Substances **2**
Box 1.1 Perspectives in Biochemistry **4**
1.1B Complex Self-Replicating Systems Evolved from Simple Molecules **4**
1.2 Cellular Architecture 7
1.2A Cells Carry Out Metabolic Reactions **7**
1.2B There Are Two Types of Cells: Prokaryotes and Eukaryotes **9**
1.2C Molecular Data Reveal Three Evolutionary Domains of Organisms **9**
1.2D Organisms Continue to Evolve **11**
Box 1.2 Pathways of Discovery **12**
1.3 Thermodynamics 13
1.3A The First Law of Thermodynamics States That Energy Is Conserved **13**
Box 1.3 Perspectives in Biochemistry **14**
1.3B The Second Law of Thermodynamics States That Entropy Tends to Increase **15**
1.3C The Free Energy Change Determines the Spontaneity of a Process **16**
1.3D Free Energy Changes Can Be Calculated from Reactant and Product Concentrations **17**
1.3E Life Achieves Homeostasis While Obeying the Laws of Thermodynamics **19**
Global Insight: Contributions of Ancient Civilizations to Biochemistry 21
Summary / Key Terms / Problems

2 Physical and Chemical Properties of Water 24

2.1 Physical Properties of Water 25
2.1A Water Is a Polar Molecule **25**
2.1B Hydrophilic Substances Dissolve in Water **27**
2.1C The Hydrophobic Effect Causes Nonpolar Substances to Aggregate in Water **30**
2.1D Water Moves by Osmosis and Solutes Move by Diffusion **33**
2.2 Chemical Properties of Water 35
2.2A Water Ionizes to Form H_3O^+ and OH^- **35**
2.2B Acids and Bases Alter the pH **36**
Box 2.1 Perspectives in Biochemistry **37**
2.2C Buffers Resist Changes in pH **39**
Box 2.2 Biochemistry in Health and Disease **41**
Global Insight: The Science of Water—A Lifeline Across Continents 42
Summary / Key Terms / Problems

3 Amino Acids: The Building Blocks of Proteins 46

3.1 Amino Acid Structure 47
3.1A The Common Amino Acids Share the Same General Structure **47**
3.1B Amino Acids Are Zwitterions at Physiological pH **50**
3.1C Amino Acid Side Chains Are Nonpolar, Polar, or Charged **50**
3.1D The pK_a Values of Ionizable Groups Depend on Nearby Groups **53**
3.1E Amino Acid Names Are Abbreviated **53**
3.2 Stereochemistry 54
3.2A Chiral Centers Give Rise to Enantiomers **55**
Box 3.1 Perspectives in Biochemistry **56**
3.2B Life is Based on Chiral Molecules **57**
3.3 Amino Acid Derivatives 58
3.3A Protein Side Chains May Be Modified **58**
Box 3.2 Perspectives in Biochemistry **59**
3.3B Some Amino Acids Are Biologically Active **59**

3.4 Polypeptides and Proteins 61
3.4A Peptide Bonds Link Amino Acids **61**
3.4B Primary Structure of Proteins **61**
Global Insight: The Power of Plant Proteins—Nutrition and Wellness Across Continents 63
Summary / Key Terms / Problems

4 Proteins: Structure and Folding 67

4.1 Secondary Structure 69
4.1A The Planar Peptide Group Limits Polypeptide Conformations **70**
4.1B The Most Common Regular Secondary Structures Are the α Helix, the β Strand, and the P_{II} Strand **73**
Box 4.1 Pathways of Discovery **74**
Box 4.2 Perspectives in Biochemistry **76**
4.1C Proteins Also Include Nonrepetitive Structure **79**
4.2 Tertiary Structure 80
4.2A Tertiary Structures Contain Combinations of Secondary Structure **80**
Box 4.3 Perspectives in Biochemistry **81**
4.2B Side Chain Location Varies with Polarity **85**
4.2C Tertiary Protein Structures Are Stabilized by Several Forces **86**
4.2D Structure Is Conserved More Than Sequence **89**
4.3 Quaternary Structure and Multiprotein Complexes 90
4.3A Proteins Assemble into Multiprotein Complexes **90**
4.3B Identical Subunits Can Be Symmetrically Arranged **91**
4.3C Diverse Proteins Can Be Assembled into Active Multiprotein Complexes **94**
4.3D Proteins Are Flexible **94**
4.4 Protein Folding and Unfolding 96
4.4A Proteins Can Be Thermally and Chemically Denatured **96**
Box 4.4 Perspectives in Biochemistry **97**
4.4B Proteins Follow Folding Pathways **98**
Box 4.5 Perspectives in Biochemistry **100**
4.4C Molecular Chaperones Assist Protein Folding **102**
Box 4.6 Protein Misfolding Can Cause Disease **105**
Biochemistry in Focus: Oxygen Transport 108
Myoglobin Is a Monomeric Oxygen-Binding Protein **108**
Hemoglobin Is a Tetramer with Two Conformations **109**
Oxygen Binds Cooperatively to Hemoglobin **110**
Hemoglobin's Two Conformations Exhibit Different Affinities for Oxygen **111**
Global Insight: Protein Folding and Diseases in Japan 117
Summary / Key Terms / Problems

5 Carbohydrates 121

5.1 Monosaccharides 122
5.1A Monosaccharides Are Aldoses or Ketoses **122**
5.1B Monosaccharides Vary in Configuration and Conformation **124**
5.1C Sugars Can Be Modified and Covalently Linked **126**
5.2 Polysaccharides 129
5.2A Lactose and Sucrose Are Disaccharides **130**
Box 5.1 Biochemistry in Health and Disease **130**
Box 5.2 Perspectives in Biochemistry **131**
5.2B Starch and Glycogen Are Storage Polysaccharides **132**
5.2C Cellulose and Chitin Are Structural Polysaccharides **134**
5.2D Glycosaminoglycans Form Highly Hydrated Gels **135**
5.3 Glycoproteins 138
5.3A Proteoglycans Contain Glycosaminoglycans **138**
5.3B Bacterial Cell Walls Are Made of Peptidoglycan **139**
Box 5.3 Biochemistry in Health and Disease **141**
5.3C Many Eukaryotic Proteins Are Glycosylated **141**
5.3D Oligosaccharides May Determine Glycoprotein Structure, Function, and Recognition **144**
Global Insight: From Ancient Grains to Modern Plates—The Enduring Power of Carbohydrates 146
Summary / Key Terms / Problems

6 Nucleotides, Nucleic Acids, and Genetic Information 150

6.1 Nucleotides and Polynucleotides 151
6.1A Nucleobases, Nucleosides, and Nucleotides **151**
6.1B Polynucleotide Primary Structure **154**
6.2 Nucleic Acid Structure: DNA 155
6.2A DNA Typically Forms a Double Helix **155**

6.2B Helical Stability Depends on Hydrogen Bonding, Stacking, and Ionic Interactions **159**
6.2C DNA Can Undergo Denaturation and Renaturation **160**
6.2D Double-Stranded DNAs Can Adopt Different Secondary Structures **161**
Box 6.1 Pathways of Discovery **163**
6.2E Tertiary Structure of Double-Stranded DNA: Supercoiling **166**
Box 6.2 Biochemistry in Health and Disease **171**
6.3 Nucleic Acid Structure: RNA 172
6.3A RNA Structures Are Highly Variable **173**
6.3B Some RNAs Are Catalysts **175**
Box 6.3 Perspectives in Biochemistry **176**
6.4 Overview of Nucleic Acid Function 178
6.4A DNA Carries Genetic Information **178**
6.4B Genes Direct Protein Synthesis **179**
Global Insight: From Genome to Medicine—Regional Excellence in Genetic Research 180
Summary / Key Terms / Problems

7 Lipids, Bilayers, and Membranes 184

7.1 Lipid Classification 185
7.1A The Properties of Fatty Acids Depend on Their Hydrocarbon Chains **185**
7.1B Triacylglycerols Contain Three Esterified Fatty Acids **187**
7.1C Glycerophospholipids Are Amphiphilic **188**
7.1D Sphingolipids Are Amino Alcohol Derivatives **189**
Box 7.1 Biochemistry in Health and Disease **190**
7.1E Steroids Contain Four Fused Rings **191**
7.1F Other Lipids Perform a Variety of Metabolic Roles **194**
Box 7.2 Biochemistry in Health and Disease **197**
7.2 Lipid Bilayers 198
7.2A Bilayer Formation Is Driven by the Hydrophobic Effect **198**
7.2B Lipid Bilayers Have Fluidlike Properties **199**
7.3 Membrane Proteins 201
7.3A There Are Several Types of Membrane Proteins **201**
7.3B Integral Membrane Proteins Interact with Hydrophobic Lipids **202**
7.3C Lipid-Linked Proteins Are Anchored to the Bilayer **206**
7.3D Peripheral Membrane Proteins Associate Loosely with Membranes **207**
7.4 Membrane Structure and Assembly 208
7.4A The Fluid Mosaic Model Accounts for Lateral Diffusion **208**
7.4B The Membrane Skeleton Helps Define Cell Shape **210**
7.4C Membrane Lipids Are Distributed Asymmetrically **212**
7.4D The Secretory Pathway Generates Secreted and Transmembrane Proteins **215**
7.4E Intracellular Vesicles Transport Proteins **218**
7.4F Proteins Mediate Vesicle Fusion **222**
Box 7.3 Biochemistry in Health and Disease **224**
Global Insight: From Olive Oil to Ghee—Lipids in Traditional Diets and Health Practices 227

8 Passive and Active Transport 231

8.1 Thermodynamics of Transport 232
8.2 Passive-Mediated Transport 234
8.2A Ionophores Carry Ions across Membranes **234**
8.2B Porins Contain β Barrels **236**
8.2C Ion Channels Are Highly Selective **237**
8.2D Aquaporins Mediate the Transmembrane Movement of Water **242**
8.2E Transport Proteins Alternate between Two Conformations **243**
Box 8.1 Perspectives in Biochemistry **244**
Box 8.2 Perspectives in Biochemistry **246**
8.3 Active Transport 247
8.3A P-Type ATPases Transport Ions in Opposite Directions **248**
Box 8.3 Biochemistry in Health and Disease **250**
8.3B ABC Transporters Pump a Diverse Collection of Molecules and Can Be Responsible for Drug Resistance **252**
8.3C Active Transport May Be Driven by Ion Gradients **254**
Global Insight: Transport for Survival—Membrane Mechanisms in Arid and Flooded Landscapes 255
Summary / Key Terms / Problems

9 Mechnanisms of Enzyme Action 259

9.1 General Properties of Enzymes 260
9.1A Enzymes Differ from Ordinary Chemical Catalysts **261**
9.1B Enzymes Are Classified by the Type of Reaction They Catalyze **261**
9.1C Enzymes Act on Specific Substrates **262**
9.2 Enzymes Work by Lowering Activation Energy 264
9.2A Transition State Theory Explains How Enzymes Catalyze Chemical Reactions **264**
9.2B Catalysts Reduce $\Delta G^{\ddagger}$ **265**
9.2C Enzymes Preferentially Bind the Transition State **266**
Box 9.1 Perspectives in Biochemistry **267**
9.3 Catalytic Mechanisms 267
9.3A Enzymes Often Catalyze Reactions in Association with Cofactors **268**
Box 9.2 Perspectives in Biochemistry **269**
9.3B Acid–Base Catalysis Occurs by Proton Transfer **269**
Box 9.3 Perspectives in Biochemistry **270**
9.3C Covalent Catalysis Usually Requires a Nucleophile **271**
9.3D Metal Ion Cofactors Act as Catalysts **274**
9.3E Catalysis Can Occur through Proximity and Orientation Effects **275**
9.4 Lysozyme 276
9.4A Lysozyme Uses Several Strategies for Catalysis **277**
9.4B Lysozyme's Catalytic Site Was Identified through Model Building **277**
9.4C The Lysozyme Reaction Proceeds via a Covalent Intermediate **279**
9.5 Serine Proteases 283
9.5A Active Site Residues Were Identified by Chemical Labeling **283**
Box 9.4 Biochemistry in Health and Disease **284**
9.5B X-ray Structures Provide Information about Catalysis, Substrate Specificity, and Evolution **285**
9.5C Serine Proteases Use Several Catalytic Mechanisms **288**
9.5D Zymogens Are Inactive Enzyme Precursors **293**
Box 9.4 Biochemistry in Health and Disease **294**
Global Insight: Industrial Enzymes and Innovations from Denmark 295
Summary / Key Terms / Problems

10 Enzyme Kinetics, Inhibition, and Control 300

10.1 Reaction Kinetics 301
10.1A Chemical Kinetics Is Described by Rate Equations **301**
10.1B Enzyme Kinetics Often Follows the Michaelis–Menten Equation **304**
Box 10.1 Pathways of Discovery **305**
10.1C Kinetic Data Can Provide Values of V_{max} and K_M **308**
10.1D Bisubstrate Reactions Follow One of Several Rate Equations **310**
10.2 Enzyme Inhibition 312
10.2A Competitive Inhibition Involves Inhibitor Binding at an Enzyme's Substrate Binding Site **313**
Box 10.2 Biochemistry in Health and Disease **315**
10.2B Uncompetitive Inhibition Involves Inhibitor Binding to the Enzyme–Substrate Complex **318**
10.2C Mixed Inhibition Involves Inhibitor Binding to Both the Free Enzyme and the Enzyme–Substrate Complex **320**
10.3 Control of Enzyme Activity 322
10.3A Allosteric Control Involves Binding at a Site Other than the Active Site **323**
10.3B Control by Covalent Modification Usually Involves Protein Phosphorylation **327**
Biochemistry in Focus: Enzymes as Targets for Drug Design 331
Drug Discovery Employs a Variety of Techniques **331**
A Drug's Bioavailability Depends on How It Is Absorbed and Transported in the Body **332**
Clinical Trials Test for Efficacy and Safety **332**
Cytochromes P450 Are Often Implicated in Adverse Drug Reactions **333**
Global Insight: Mechanistic Enzymology in Israel 334
Summary / Key Terms / Problems

11 Hormones and Signal Transduction 339

11.1 Hormones 340
11.1A Pancreatic Islet Hormones Control Fuel Metabolism **341**
Box 11.1 Pathways to Discovery **342**
11.1B Epinephrine and Norepinephrine Prepare the Body for Action **343**

11.1C Steroid Hormones Regulate a Wide Variety of Metabolic and Sexual Processes **344**
11.1D Growth Hormone Binds to Receptors in Muscle, Bone, and Cartilage **345**
11.2 Receptor Tyrosine Kinases 347
11.2A Receptor Tyrosine Kinases Transmit Signals across the Cell Membrane **347**
Box 11.2 Perspectives in Biochemistry **348**
11.2B Kinase Cascades Relay Signals to the Nucleus **351**
Box 11.3 Biochemistry in Health and Disease **355**
11.2C Some Receptors Are Associated with Nonreceptor Tyrosine Kinases **356**
11.2D Protein Phosphatases Are Signaling Proteins in Their Own Right **359**
11.3 Heterotrimeric G Proteins 362
11.3A G-Protein–Coupled Receptors Contain Seven Transmembrane Helices **363**
11.3B Heterotrimeric G Proteins Dissociate on Activation **364**
11.3C Adenylate Cyclase Synthesizes cAMP to Activate Protein Kinase A **366**
11.3D Phosphodiesterases Limit Second Messenger Activity **369**
Box 11.4 Biochemistry in Health and Disease **370**
11.4 The Phosphoinositide Pathway 371
11.4A Ligand Binding Results in the Cytoplasmic Release of the Second Messengers IP_3 and Ca^{2+} **372**
11.4B Calmodulin Is a Ca2+-Activated Switch **373**
11.4C DAG Is a Lipid-Soluble Second Messenger That Activates Protein Kinase C **375**
11.4D Complex Systems Have Emergent Properties **376**
Biochemistry in Focus: Chemical Signaling and Movement 378
Muscle Consists of Interdigitated Thick and Thin Filaments **378**
Muscle Contraction Occurs When Myosin Heads Walk Up Thin Filaments **382**
Global Insight: Adaptogens and Beyond—The Biochemical Legacy of Traditional Medicine 384
Summary / Key Terms / Problems

12 Bioenergetics 388

12.1 Overview of Metabolism 389
12.1A Nutrition Involves Food Intake and Use **389**
12.1B Vitamins and Minerals Assist Metabolic Reactions **390**
12.1C Metabolic Pathways Consist of Series of Enzymatic Reactions **391**
Box 12.1 Perspectives in Biochemistry **393**
12.1D Thermodynamics Dictates the Direction and Regulatory Capacity of Metabolic Pathways **395**
12.1E Metabolic Flux Must Be Controlled **396**
12.2 "High-Energy" Compounds 398
Box 12.2 Pathways of Discovery **399**
12.2A ATP Has a High Phosphoryl Group-Transfer Potential **399**
12.2B Phosphoryl Group Transfers Can Drive Endergonic Processes **401**
Box 12.3 Perspectives in Biochemistry **401**
12.2C Some Other Phosphorylated Compounds Have High Phosphoryl Group-Transfer Potentials **403**
12.2D Thioesters Are Energy-Rich Compounds **405**
12.3 Oxidation–Reduction Reactions 407
12.3A NAD^+ and FAD Are Electron Carriers **407**
12.3B The Nernst Equation Describes Oxidation–Reduction Reactions **409**
12.3C Spontaneity Can Be Determined by Measuring Reduction Potential Differences **410**
12.4 Experimental Approaches to the Study of Metabolism 413
12.4A Labeled Metabolites Can Be Traced **414**
12.4B Studying Metabolic Pathways Often Involves Perturbing the System **416**
12.4C Systems Biology Has Entered the Study of Metabolism **416**
Global Insights: Cultural Nutrition—The Metabolic Benefits of Traditional Eating Patterns 418
Summary / Key Terms / Problems

13 Glycolysis and the Pentose Phosphate Pathway 422

Box 13.1 Pathways of Discovery **424**
13.1 Overview of Glycolysis 425
13.2 The Reactions of Glycolysis 427
13.2A Hexokinase Uses the First ATP **427**
13.2B Phosphoglucose Isomerase Converts Glucose-6-Phosphate to Fructose-6-Phosphate **429**
13.2C Phosphofructokinase Uses the Second ATP **430**

13.2D Aldolase Converts a 6-Carbon Compound to Two 3-Carbon Compounds **431**
13.2E Triose Phosphate Isomerase Interconverts Dihydroxyacetone Phosphate and Glyceraldehyde-3-Phosphate **432**
13.2F Glyceraldehyde-3-Phosphate Dehydrogenase Forms the First "High-Energy" Intermediate **436**
13.2G Phosphoglycerate Kinase Generates the First ATP **438**
13.2H Phosphoglycerate Mutase Interconverts 3-Phosphoglycerate and 2-Phosphoglycerate **439**
Box 13.2 Perspectives in Biochemistry **441**
13.2I Enolase Forms the Second "High-Energy" Intermediate **441**
13.2J Pyruvate Kinase Generates the Second ATP **442**
13.3 Metabolism of Hexoses Other Than Glucose 445
13.3A Fructose Is Converted to Fructose-6-Phosphate or Glyceraldehyde-3-Phosphate **445**
13.3B Galactose Is Converted to Glucose-6-Phosphate **447**
13.3C Mannose Is Converted to Fructose-6-Phosphate **449**
13.4 Fermentation: The Anaerobic Fate of Pyruvate 449
13.4A The Pyruvate Produced by Glycolysis Has Three Common Fates **450**
13.4B Homolactic Fermentation Converts Pyruvate to Lactate **450**
13.4C Alcoholic Fermentation Converts Pyruvate to Ethanol and CO_2 **451**
13.4D Fermentation Is Energetically Favorable **454**
Box 13.3 Perspectives in Biochemistry **455**
13.5 Gluconeogenesis 456
13.5A Pyruvate Is Converted to Phosphoenolpyruvate in Two Steps **456**
13.5B Hydrolytic Reactions Bypass Irreversible Glycolytic Reactions **460**
13.6 Regulation of Glycolysis and Gluconeogenesis 461
13.6A Phosphofructokinase Is the Major Flux-Controlling Enzyme of Glycolysis in Muscle **462**
13.6B Substrate Cycling Fine-Tunes Flux Control **465**
13.6C Gluconeogenesis and Glycolysis Are Independently Regulated **466**
13.7 The Pentose Phosphate Pathway 469
13.7A NADPH and NADH Are Not Metabolically Interchangeable **469**
13.7B Oxidative Reactions Produce NADPH in Stage 1 **471**
13.7C Isomerization and Epimerization of Ribulose-5-Phosphate Occur in Stage 2 **472**
13.7D Stage 3 Involves Carbon–Carbon Bond Cleavage and Formation **472**
13.7E The Pentose Phosphate Pathway Must Be Regulated **473**
Box 13.4 Biochemistry in Health and Disease **475**
Global Insight: From Kimchi to Kefir—The Global Legacy of Fermentation 476
Summary / Key Terms / Problems

14 Additional Pathways in Carbohydrate Metabolism 481

14.1 Glycogen Breakdown 483
Box 14.1 Pathways of Discovery **484**
14.1A Glycogen Phosphorylase Degrades Glycogen to Glucose-1-Phosphate **485**
14.1B Glycogen Debranching Enzyme Acts as a Glucosyltransferase **487**
14.1C Phosphoglucomutase Interconverts Glucose-1-Phosphate and Glucose-6-Phosphate **488**
Box 14.2 Biochemistry in Health and Disease **489**
14.2 Glycogen Synthesis 490
14.2A UDP-Glucose Pyrophosphorylase Activates Glucosyl Units **491**
14.2B Glycogen Synthase Extends Glycogen Chains **492**
14.2C Glycogen Branching Enzyme Transfers Seven-Residue Glycogen Segments **494**
14.3 Control of Glycogen Metabolism 495
14.3A Glycogen Phosphorylase and Glycogen Synthase Are under Allosteric Control **495**
14.3B Glycogen Phosphorylase and Glycogen Synthase Undergo Control by Covalent Modification **496**
14.3C Glycogen Metabolism Is Subject to Hormonal Control **500**
14.4 Other Carbohydrate Biosynthetic Pathways 502
Box 14.3 Perspectives in Biochemistry **502**
14.4A Nucleotide Sugars Power the Formation of Glycosidic Bonds **503**

14.4B *O*-Linked Oligosaccharides Are Posttranslationally Formed **503**
14.4C *N*-Linked Oligosaccharides Are Constructed on Dolichol Carriers **503**
Box 14.4 Biochemistry in Health and Disease **505**
Global Insight: Fueling Tradition—Glycogen Metabolism in Regional Sports and Physical Culture 505
Summary / Key Terms / Problems

15 The Citric Acid Cycle 509

15.1 Overview of the Citric Acid Cycle 510
Box 15.1 Pathways of Discovery **512**
15.2 Synthesis of Acetyl-S-Coenzyme A 513
15.2A Pyruvate Dehydrogenase Is a Multienzyme Complex **514**
15.2B The Pyruvate Dehydrogenase Complex Catalyzes Five Reactions **515**
15.3 Enzymes of the Citric Acid Cycle 520
15.3A Citrate Synthase Joins an Acetyl Group to Oxaloacetate **520**
15.3B Aconitase Interconverts Citrate and Isocitrate **521**
15.3C NAD^+-Dependent Isocitrate Dehydrogenase Releases CO_2 **522**
15.3D α-Ketoglutarate Dehydrogenase Resembles Pyruvate Dehydrogenase **523**
15.3E Succinyl-CoA Synthetase Produces GTP **524**
15.3F Succinate Dehydrogenase Generates $FADH_2$ **525**
15.3G Fumarase Produces Malate **526**
15.3H Malate Dehydrogenase Regenerates Oxaloacetate **526**
15.4 Regulation of the Citric Acid Cycle 527
15.4A Pyruvate Dehydrogenase Is Regulated by Product Inhibition and Covalent Modification **529**
15.4B Three Enzymes Control the Rate of the Citric Acid Cycle **529**
15.5 Reactions Related to the Citric Acid Cycle 531
15.5A Other Pathways Use Citric Acid Cycle Intermediates **532**
15.5B Some Reactions Replenish Citric Acid Cycle Intermediates **533**
Box 15.2 Perspectives in Biochemistry **534**
15.5C The Glyoxylate Cycle Shares Some Steps with the Citric Acid Cycle **536**
Global Insight: Metabolic Harmony—Traditional Diets and the Citric Acid Cycle 538
Summary / Key Terms / Problems

16 Mitochondrial ATP Synthesis 541

16.1 The Mitochondrion 543
16.1A Mitochondria Contain a Highly Folded Inner Membrane **543**
16.1B Ions and Metabolites Enter Mitochondria via Transporters **544**
16.2 Electron Transport 547
16.2A Electron Transport Is an Exergonic Process **547**
16.2B Electron Carriers Operate in Sequence **548**
16.2C Complex I Accepts Electrons from NADH **550**
16.2D Complex II Contributes Electrons to Coenzyme Q **556**
Box 16.1 Perspectives in Biochemistry **557**
16.2E Complex III Translocates Protons via the Q Cycle **558**
16.2F Complex IV Reduces Oxygen to Water **562**
16.3 Oxidative Phosphorylation 565
16.3A The Chemiosmotic Theory Links Electron Transport to ATP Synthesis **565**
Box 16.2 Pathways of Discovery **567**
Box 16.3 Perspectives in Biochemistry **568**
16.3B The Structure of ATP Synthase Is Arranged into Two Domains **568**
16.3C ATP Synthase Is Driven by the Flow of Protons **571**
16.4 Control of Oxidative Metabolism 576
16.4A The Rate of Oxidative Phosphorylation Depends on the ATP and NADH Concentrations **577**
16.4B Oxidative Phosphorylation Can Be Uncoupled from Electron Transport **578**
16.4C Aerobic Metabolism Has Some Disadvantages **580**
Box 16.4 Perspectives in Biochemistry **580**
Box 16.5 Biochemistry in Health and Disease **581**
Biochemistry in Focus: The Mitochondrion and Cell Death 583
Apoptosis Is an Orderly Process **583**
Mitochondrial Membrane Integrity Is Regulated **586**
Global Insight: Mitochondrial Medicine—Global Advances in Electron Transport and Therapy 588
Summary / Key Terms / Problems

17 Photosynthesis 592

17.1 Chloroplasts 594
17.1A The Light Reactions Take Place in the Thylakoid Membrane **594**
17.1B Pigment Molecules Absorb Light **595**
17.2 The Light Reactions 598
17.2A Light Energy Is Transformed to Chemical Energy **598**
17.2B Electron Transport in Photosynthetic Bacteria Follows a Circular Path **599**
17.2C Two-Reaction-Center Electron Transport Is a Linear Pathway That Produces O_2 and NADPH **602**
Box 17.1 Perspectives in Biochemistry **613**
17.2D The Proton Gradient Drives ATP Synthesis by Photophosphorylation **613**
17.3 The Dark Reactions 615
17.3A The Calvin Cycle Fixes CO_2 **615**
17.3B Calvin Cycle Products Are Converted to Starch, Sucrose, and Cellulose **620**
17.3C The Calvin Cycle Is Controlled Indirectly by Light **621**
17.3D Photorespiration Competes with Photosynthesis **623**
Global Insight: From Deserts to Rainforests—Photosynthetic Innovation in Regional Flora 626
Summary / Key Terms / Problems

18 Synthesis and Degradation of Lipids 629

18.1 Lipid Digestion, Absorption, and Transport 630
18.1A Triacylglycerols Are Digested before They Are Absorbed **631**
18.1B Lipids Are Transported as Lipoproteins **633**
18.2 Fatty Acid Oxidation 637
18.2A Fatty Acids Are Activated by Their Attachment to Coenzyme A **638**
18.2B Carnitine Carries Acyl Groups Across the Mitochondrial Membrane **639**
18.2C β Oxidation Degrades Fatty Acids to Acetyl-SCoA **640**
18.2D Oxidation of Unsaturated Fatty Acids Requires Additional Enzymes **643**
18.2E Oxidation of Odd-Chain Fatty Acids Yields Propionyl-SCoA **645**
Box 18.1 Pathways of Discovery **647**
18.2F Peroxisomal β Oxidation Differs from Mitochondrial β Oxidation **650**
18.2G Ketone Bodies **651**
18.3 Fatty Acid Biosynthesis 653
18.3A Mitochondrial Acetyl-SCoA Must Be Transported into the Cytosol **654**
18.3B Acetyl-CoA Carboxylase Produces Malonyl-SCoA **655**
18.3C Fatty Acid Synthase Catalyzes Seven Reactions **655**
18.3D Fatty Acids May Be Elongated and Desaturated **660**
18.3E Fatty Acids Are Esterified to Form Triacylglycerols **661**
18.3F Regulation of Fatty Acid Metabolism **663**
18.4 Synthesis of Other Lipids 665
18.4A Glycerophospholipids Are Built from Intermediates of Triacylglycerol Synthesis **665**
18.4B Sphingolipids Are Built from Palmitoyl-SCoA and Serine **669**
18.4C C_{20} Fatty Acids Are the Precursors of Prostaglandins **669**
Box 18.2 Biochemistry in Health and Disease **670**
18.5 Cholesterol Metabolism 673
18.5A Cholesterol Is Synthesized from Acetyl-SCoA **673**
18.5B HMG-CoA Reductase Controls the Rate of Cholesterol Synthesis **677**
18.5C Abnormal Cholesterol Transport Leads to Atherosclerosis **679**
Global Insight: Lipid Wisdom—Traditional Diets and the Biochemistry of Fat Metabolism 681
Summary / Key Terms / Problems

19 Synthesis and Degradation of Amino Acids 685

19.1 Protein Degradation 686
19.1A Lysosomes Degrade Many Proteins **687**
19.1B Ubiquitin Marks Proteins for Degradation **687**
19.1C The Proteasome Unfolds and Hydrolyzes Ubiquitinated Polypeptides **689**
19.2 Amino Acid Deamination and the Urea Cycle 692
19.2A Transaminases Use PLP to Transfer Amino Groups **693**
19.2B Glutamate Can Be Oxidatively Deaminated **695**
19.2C The Urea Cycle Packages Nitrogen for Excretion **696**
19.2D The Urea Cycle Is Regulated by Substrate Availability **700**

19.3 Breakdown of Amino Acids 701
19.3A Alanine, Cysteine, Glycine, Serine, and Threonine Are Degraded to Pyruvate **702**
19.3B Asparagine and Aspartate Are Degraded to Oxaloacetate **704**
19.3C Arginine, Glutamate, Glutamine, Histidine, and Proline Are Degraded to α-Ketoglutarate **704**
19.3D Methionine, Threonine, Isoleucine, and Valine Are Degraded to Succinyl-SCoA **705**
Box 19.1 Biochemistry in Health and Disease **709**
19.3E Leucine and Lysine Are Degraded Only to Acetyl-SCoA and/or Acetoacetate **710**
19.3F Tryptophan Is Degraded to Alanine and Acetoacetate **712**
19.3G Phenylalanine and Tyrosine Are Degraded to Fumarate and Acetoacetate **713**
Box 19.2 Biochemistry in Health and Disease **714**
19.4 Amino Acid Biosynthesis 715
19.4A Nonessential Amino Acids Are Synthesized from Common Metabolites **716**
19.4B Plants and Microorganisms Synthesize the Essential Amino Acids **720**
19.5 Other Products of Amino Acid Metabolism 726
19.5A Heme Is Synthesized from Glycine and Succinyl-SCoA **726**
Box 19.3 Biochemistry in Health and Disease **728**
19.5B Amino Acids Are Precursors of Physiologically Active Amines **730**
19.5C Nitric Oxide Is Derived from Arginine **731**
Biochemistry in Focus: Nitrogen Fixation 733
Nitrogenase Reduces N_2 to NH_3 **734**
Fixed Nitrogen Is Assimilated into Biological Molecules **735**
Global Insight: Healing Molecules—Amino Acid Metabolism in Traditional Diets and Medicines 737
Summary / Key Terms / Problems

20 Regulation of Fuel Metabolism 741

20.1 Organ Specialization 742
Box 20.1 Biochemistry in Health and Disease **744**
20.1A The Brain Requires a Steady Supply of Glucose **745**
20.1B Muscle Utilizes Glucose, Fatty Acids, and Ketone Bodies **745**
20.1C Adipose Tissue Stores and Releases Fatty Acids and Hormones **746**
20.1D Liver Is the Body's Central Metabolic Clearinghouse **747**
20.1E Kidney Filters Wastes and Maintains Blood pH **749**
20.1F Blood Transports Metabolites in Interorgan Metabolic Pathways **749**
20.2 Hormonal Control of Fuel Metabolism 751
20.2A Insulin Release Is Triggered by Glucose **751**
20.2B Glucagon and Catecholamines Counter the Effects of Insulin **753**
20.3 Metabolic Homeostasis: The Regulation of Energy Metabolism, Appetite, and Body Weight 756
20.3A AMP-Dependent Protein Kinase Is the Cell's Fuel Gauge **756**
20.3B Adipocytes and Other Tissues Help Regulate Fuel Metabolism and Appetite **757**
20.3C Energy Expenditure Can Be Controlled by Adaptive Thermogenesis **759**
20.4 Disturbances in Fuel Metabolism 760
20.4A Starvation Leads to Metabolic Adjustments **760**
20.4B Diabetes Mellitus Is Characterized by High Blood Glucose Levels **762**
Box 20.2 Pathways of Discovery **763**
20.4C Obesity Is Usually Caused by Excessive Food Intake **765**
20.4D Cancer Metabolism **766**
Global Insight: Metabolism Under Pressure—Regional Disorders and Energy Regulation 769
Summary / Key Terms / Problems

21 Nucleotide Synthesis and Degradation 772

21.1 Synthesis of Purine Ribonucleotides 773
21.1A Purine Synthesis Yields Inosine Monophosphate **774**
21.1B IMP Is Converted to Adenine and Guanine Ribonucleotides **776**
21.3C Purine Nucleotide Biosynthesis Is Regulated at Several Steps **778**
21.3D Purines Can Be Salvaged **779**
21.2 Synthesis of Pyrimidine Ribonucleotides 780
21.2A UMP Is Synthesized in Six Steps **780**
21.2B UMP Is Converted to UTP and CTP **782**
21.2C Pyrimidine Nucleotide Biosynthesis Is Regulated at ATCase or Carbamoyl Phosphate Synthetase II **782**

21.3 Formation of Deoxyribonucleotides **783**
21.3A Ribonucleotide Reductase Converts Ribonucleotides to Deoxyribonucleotides **784**
21.3B dUMP Is Methylated to Form Thymine **788**
Box 21.1 Biochemistry in Health and Disease **792**
21.4 Nucleotide Degradation **793**
21.4A Purine Catabolism Yields Uric Acid **794**
21.4B Some Animals Degrade Uric Acid **797**
21.4C Pyrimidines Are Broken Down to Malonyl-SCoA and Methylmalonyl-SCoA **798**
Box 21.2 Pathways of Discovery **799**
Global Insight: Molecules of Life—Nucleotide Metabolism and Regional Breakthroughs **801**
Summary / Key Terms / Problems

22 DNA Replication 804

22.1 Overview of DNA Replication **805**
22.1A DNA Is Synthesized in the 5′→3′ Direction **806**
22.1B DNA Synthesis Extends RNA Primers **807**
22.2 Prokaryotic DNA Replication **809**
22.2A DNA Polymerases Add Correctly Paired Nucleotides **809**
Box 22.1 Pathways of Discovery **810**
22.2B Replication Initiation and Elongation Require Helicase and Primase **814**
22.2C The Leading and Lagging Strands Are Synthesized Simultaneously **817**
22.2D Replication Terminates at Specific Sites **821**
22.2E DNA Is Replicated with High Fidelity **822**
22.3 Eukaryotic DNA Replication **823**
22.3A Eukaryotes Use Several DNA Polymerases **823**
Box 22.2 Perspectives in Biochemistry **825**
22.3B Eukaryotic DNA Is Replicated from Multiple Origins **826**
22.3C Telomerase Extends Chromosome Ends **827**
Box 22.3 Biochemistry in Health and Disease **829**
Global Insight: Replication and Repair—Regional Leadership in Genomic Research **830**
Summary / Key Terms / Problems

23 DNA Synthesis and Repair 833

23.1 DNA Damage **834**
23.1A Environmental and Chemical Agents Generate Mutations **835**
Box 23.1 Perspectives in Biochemistry **837**
23.1B Many Mutagens Are Carcinogens **838**
23.2 DNA Repair **839**
23.2A Some Damage Can Be Directly Reversed **840**
23.2B Base Excision Repair Requires a Glycosylase **840**
Box 23.2 Perspectives in Biochemistry **841**
23.2C Nucleotide Excision Repair Removes a Segment of a DNA Strand **842**
23.2D Mismatch Repair Corrects Replication Errors **844**
23.2E Some DNA Repair Mechanisms Introduce Errors **844**
23.3 Recombination and Transposons **847**
23.3A Homologous Recombination Involves Several Protein Complexes **847**
23.3B DNA Can Be Repaired by Recombination **853**
23.3C Transposition Rearranges Segments of DNA **855**
Biochemistry in Focus: Antibodies **859**
Antibodies Have Constant and Variable Regions **859**
Classes of Human Immunoglobulins **859**
Antibodies Recognize a Huge Variety of Antigens **860**
Some Antibody-Mediated Autoimmune Diseases **864**
Global Insight: Molecular Maintenance—DNA Repair Pathways and Regional Innovation **864**
Summary / Key Terms / Problems

24 RNA Metabolism 868

24.1 Prokaryotic RNA Transcription **869**
24.1A RNA Polymerase Resembles Other Polymerases **870**
24.1B Transcription Is Initiated at a Promoter **872**
24.1C The RNA Chain Elongates from the 5′ to 3′ End **874**
Box 24.1 Perspectives in Biochemistry **875**

24.1D Transcription Terminates at Specific Sites **876**
24.2 Transcription in Eukaryotes 879
24.2A Eukaryotes Have Several RNA Polymerases **879**
Box 24.2 Biochemistry in Health and Disease **880**
24.2B Each Polymerase Recognizes a Different Type of Promoter **884**
24.2C Transcription Factors Are Required to Initiate Transcription **886**
24.3 Posttranscriptional Processing 891
24.3A Messenger RNAs Undergo 5′ Capping and Addition of a 3′ Tail **891**
24.3B Splicing Removes Introns from Eukaryotic Genes **893**
Box 24.3 Pathways of Discovery **894**
24.3C Ribosomal RNA Precursors May Be Cleaved, Modified, and Spliced **903**
24.3D Transfer RNAs Are Processed by Nucleotide Removal, Addition, and Modification **906**
Global Insight: Gene Expression Unveiled—Collaborative Discoveries in RNA Biology 909
Summary / Key Terms / Problems

25 The Genetic Code and Translation 912

25.1 The Genetic Code 913
25.1A Codons Are Triplets That Are Read Sequentially **914**
25.1B The Genetic Code Was Systematically Deciphered **915**
25.1C The Genetic Code Is Degenerate and Nonrandom **916**
Box 25.1 Perspectives in Biochemistry **918**
25.2 Transfer RNA and Its Aminoacylation 919
25.2A All tRNAs Have Similar Structures **919**
25.2B Aminoacyl–tRNA Synthetases Attach Amino Acids to tRNAs **921**
25.2C Most tRNAs Recognize More than One Codon **926**
Box 25.2 Perspectives in Biochemistry **927**
25.3 Ribosomes 928
25.3A The Prokaryotic Ribosome Consists of Two Subunits **928**
25.3B The Eukaryotic Ribosome Contains a Buried Prokaryotic Ribosome **934**
25.4 Translation 936
25.4A Chain Initiation Requires an Initiator tRNA and Initiation Factors **937**
25.4B The Ribosome Decodes the mRNA, Catalyzes Peptide Bond Formation, Then Moves to the Next Codon **943**
Box 25.3 Biochemistry in Health and Disease **953**
25.4C Release Factors Terminate Translation **954**
25.5 Posttranslational Processing 957
25.5A Ribosome-Associated Chaperones Help Proteins Fold **957**
25.5B Newly Synthesized Proteins May Be Covalently Modified **959**
Global Insight: The Language of Life—Protein Synthesis Research Across Continents 962
Summary / Key Terms / Problems

APPENDIX A Methods 966

A.1 Biomolecule Purification and Analysis 967
A.1A Purifying a Biomolecule Requires a Strategy **967**
A.1B Salting Out Separates Proteins by Their Solubility **970**
A.1C Chromatography Involves Interaction with Mobile and Stationary Phases **971**
A.1D Electrophoresis Separates Molecules According to Charge and Size **974**
A.1E Ultracentrifugation Separates Macromolecules by Mass **978**
A.2 Protein Sequencing 979
A.2A Disruption of Quaternary Structure **979**
A.2B The Polypeptide Chains Are Cleaved **982**
A.2C Edman Degradation Removes a Peptide's N-Terminal Amino Acid Residue **984**
A.2D Peptides Can Be Sequenced by Mass Spectrometry **985**
A.2E Reconstructed Protein Sequences Are Stored in Databases **986**
A.2F Protein Sequences Reveal Evolutionary Relationships **988**
A.3 Nucleic Acid Sequencing 991
A.3A Restriction Endonucleases Cleave DNA at Specific Sequences **992**
A.3B Traditional DNA Sequencing Uses the Chain-Terminator Method **993**
A.3C Next-Generation Sequencing Technologies Are Massively Parallel **995**
A.3D Entire Genomes Have Been Sequenced **996**
A.3E Evolution Results from Sequence Mutations **998**

A.4 Manipulating DNA 1000
A.4A Cloned DNA Is an Amplified Copy **1000**
A.4B DNA Libraries Are Collections of Cloned DNA **1003**
A.4C DNA Is Amplified by the Polymerase Chain Reaction **1005**
A.4D Recombinant DNA Technology Has Numerous Practical Applications **1006**
A.5 Structural Methods 1009
A.5A Circular Dichroism Spectroscopy Provides Low-Resolution Determination of Secondary Structure **1009**
A.5B X-ray Crystallography Directly Images Molecules in Crystals **1010**
A.5C Structures Can Be Determined in Solution by NMR Spectroscopy **1011**
A.5D Cryo-Electron Microscopy Directly Images Large Macromolecular Structures **1013**

APPENDIX B Element Color Key **1015**

Glossary **G-1**

Index **I-1**
