"One of the best books to teach a physical chemistry course for biological or medical students. The book illustrates the basic concepts of thermodynamics, kinetics, structure, spectroscopy, and other topics in a clear and organized manner without oversimplification."

Dr Ismail Badran | An-Najah University

"This edition is made very accessible thanks to the specific structure and learning features, which are very effective, including key points at the start, relevant examples from life sciences, and step-by-step worked out examples and equations."

Dr Cecile Dreiss | King's College London

"This is a textbook that any student of Biochemistry, Physiology, Pharmacology, Molecular genetics, Molecular Biology will find very useful. Lots of up-to-date information and the maths, if students are prepared to do some work, is not daunting but rewarding."

Dr Nicholas Brewer | University of Dundee

Molecular assemblies, macromolecules, proteins, nucleic acids: they form a substantial part of all living organisms, from plants to humans. Indeed, they are critical for keeping all organisms alive. But how do they operate? Chemical processes are at the core of life: understanding life means unveiling the physical principles on which it is built.

From thermodynamics to molecular interactions, *Physical Chemistry for the Life Sciences* 3rd edition explains how the principles of physical chemistry apply to the processes of life. Offering worked examples and numerous case studies throughout, students are supported to master even the most complex concepts and how they apply in biological contexts, while acquiring key problem-solving and mathematical skills. Directly addressing the main challenges faced by students, its pedagogically rich approach provides an accessible and wide-ranging guide. The extended scope of this new edition includes the essential techniques that can be used to characterize biological systems, including biochemical spectroscopy, x-ray diffraction, and spectrometry.

New to this edition:

- Extended coverage of spectroscopy techniques incorporates the latest developments and challenges of teaching this topic
- Updated and revised **Chemist's toolkits** review mathematical and physical concepts to enhance understanding, and to develop both mathematical skills and problem-solving
- Newly developed exercises, with accompanying solutions manual available for instructors, to provide extra support and teaching resources.

For registered adopters:

- Accompanying solutions manual for all the discussion questions and exercises.
- Figures and tables from the book

PETER ATKINS
Emeritus Professor of Physical Chemistry, University of Oxford, and Fellow of Lincoln College, Oxford, UK.

R. GEORGE RATCLIFFE
Emeritus Professor of Plant Sciences, University of Oxford, and Emeritus Fellow of New College, Oxford, UK.

MARK R. WORMALD
Senior Tutor and Tutorial Fellow in Biochemistry and Chemistry at Corpus Christi College in the University of Oxford, UK.

JULIO DE PAULA
Professor of Chemistry, Lewis & Clark College, Portland, Oregon, USA.
