

# Contents

Conference Participants, iii

Preface, v

## **Interaction of FLP Protein with its Recombination Site**

1

R.C. Bruckner, J.F. Senecoff, L. Meyer-Leon, and  
M.M. Cox

## **Interaction of the FLP Recombinase of the 2-Micron Plasmid with its Target Sequence**

7

P.D. Sadowski, B.J. Andrews, L.G. Beatty, D. Sidenberg,  
and G. Proteau

## **Site-specific Recombination Promotes Plasmid Amplification in Yeast**

11

F.C. Volkert and J.R. Broach

## **Double-strand-break Repair in Yeast Results in Conversion Events That Resemble Mating-type Switching**

19

M. Jayaram

## **Recombination of Mitochondrial Genes**

25

R.A. Butow, P.S. Perlman, and A.R. Zinn

## **A Recombination-stimulating Sequence in the Ribosomal RNA Gene Cluster of Yeast**

29

G.S. Roeder, R.L. Keil, and K.A. Voelkel-Meiman

## **Switching Genes in *Schizosaccharomyces pombe* and DNA Rearrangements in the Mating-type Region of *S. pombe***

35

H. Gutz, L. Heim, P. Kapitza, and H. Schmidt

## **Relationship of DNA Breakage at the *smt* Site and Mating-type Switching in *Schizosaccharomyces pombe***

41

R. Egel

|                                                                                                                                                                                                                                          |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Initiation and Resolution Steps of Recombination for Yeast Mating-type Interconversion</b><br>A.J.S. Klar                                                                                                                             | 47  |
| <b>Intermediates in Homothallic Switching</b><br>J. Strathern, C. McGill, B. Shafer, and D. Raveh                                                                                                                                        | 53  |
| <b>Stimulation of Mitotic Recombination by <i>HO</i> Nuclease</b><br>J.A. Nickoloff, E. Chen, and F. Heffron                                                                                                                             | 61  |
| <b>Double-chain Breaks: Thinking about Them in Phage and Fungi</b><br>F.W. Stahl, D.S. Thaler, A. Kolodkin, S. Rosenberg, and E. Sampson                                                                                                 | 69  |
| <b>The Role of <i>RAD50</i> in Meiotic Intrachromosomal Recombination</b><br>J. Wagstaff, S. Gottlieb, and R. Easton Esposito                                                                                                            | 75  |
| <b>Screening for Recombination-defective Mutants with a Positive Selection System for Plasmid Excision</b><br>R.H. Schiestl and P.J. Hastings                                                                                            | 85  |
| <b>Genetic and Molecular Analyses of Recombination Using Mutants Altered in DNA Repair and Sister Chromatid Recombination</b><br>M.A. Resnick, A.M. Chaudhury, and J.L. Nitiss                                                           | 89  |
| <b>A Site for the Initiation of Gene Conversion in Meiosis</b><br>R.E. Malone, S. Cramton, and R. Gehrhardt                                                                                                                              | 95  |
| <b><i>REC</i> Genes Governing Mitotic Recombination, Chromosomal Stability, and Sporulation: Cell Type and Life Cycle Stage-specific Expression of <i>rec</i> Mutants</b><br>M.S. Esposito, K. Bjornstad, L.L. Holbrook, and D.T. Maleas | 103 |
| <b>Association of Reciprocal Exchange and Intrachromosomal Gene Conversion in Mitosis</b><br>H.L. Klein and K.K. Willis                                                                                                                  | 111 |

|                                                                                                                                                                                                                          |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>High-frequency Meiotic Recombination Events Do Not Require End-to-end Chromosome Synapsis</b><br>S. Jinks-Robertson and T.D. Petes                                                                                    | 117 |
| <b>Meiotic Recombination between Dispersed Homologous Sequences in <i>Saccharomyces cerevisiae</i></b><br>M. Lichten, R.H. Borts, and J.E. Haber                                                                         | 123 |
| <b>Genetic Control of Delta Recombination</b><br>J.W. Wallis, G. Chrebet, A. Beniaminovitz, and R. Rothstein                                                                                                             | 131 |
| <b>Detecting Heteroduplex DNA in Postmeiotic Segregation: And Recombination in a Nontandem <i>ADE8</i> Duplication</b><br>S. Fogel, J.W. White, A. Plessis, and D. Maloney                                               | 137 |
| <b>Gene Conversion and Associated Recombination in Heterozygous Versus Heteroallelic Diploid Cells</b><br>H. Roman                                                                                                       | 141 |
| <b>Synapsis-dependent Illegitimate Recombination and Rearrangement in Yeast</b><br>S. Kunes, D. Botstein, and M.S. Fox                                                                                                   | 149 |
| <b>Is There Distributive Pairing in <i>Saccharomyces cerevisiae</i>?</b><br>D.B. Kaback                                                                                                                                  | 157 |
| <b>Enzymatic Systems from <i>Saccharomyces cerevisiae</i> That Catalyze the Processing of Holliday Junctions and the Repair of Mismatched Nucleotides</b><br>R. Kolodner, D. Evans, L.S. Symington, and C. Muster-Nassal | 165 |
| <b>Ty Element Retrotransposition</b><br>D.J. Garfinkel, J.D. Boeke, and G.R. Fink                                                                                                                                        | 173 |
| <b>Gene Conversion Mechanisms of Punctual and Non-punctual Mutations in <i>Ascombolus</i></b><br>A. Nicolas, H. Hamza, and J.-L. Rossignol                                                                               | 181 |
| <b>SUMMARY</b><br>J.N. Strathern                                                                                                                                                                                         | 189 |
