1. Maintenance of a Hereditary Virus: The Sigma Virus in Populations of Its Host, <i>Drosophila melanogaster</i>	1
<i>Annie Fleuriot</i>	
Introduction	1
French Populations of <i>Drosophila melanogaster</i>	2
Polymorphism of Populations	2
Characteristics of Wild Strains of the Sigma Virus	3
Effects of the Infection upon Carriers	7
Experimental Populations	9
Maintenance of the Virus in French Natural Populations . . .	12
Geographical Variation of the <i>Drosophila</i> -Sigma System . . .	14
Polymorphism of Populations	14
Viral Characteristics	17
Tentative Interpretation of the Geographical Pattern Observed	18
Other Systems of Vertically Transmitted Viruses	22
Existence of Different Sensitivities to the Virus	22
Characteristics of the Viruses	23
Maintenance in the Vector Population	24
Appendix: Transmission of Stabilized and Nonstabilized	
Conditions	26
Self-Maintenance of Stabilized Condition through Maternal	
Lineage	26
Nonstabilized Condition	27
References	28
2. Domestication: Evolutionary Change under Stress	31
<i>M. J. Kohane and P. A. Parsons</i>	
Introduction	31
Environmental Change and Domestication	33

Ecological Phenotypes	33
Behavioral Phenotypes	36
Adaptation to Laboratory Conditions	37
A Case Study: Domestication in Foxes	41
Discussion	43
Summary	45
References	46
3. Range Expansion and Its Genetic Consequences in Populations of the Giant Toad, <i>Bufo marinus</i>	49
<i>Simon Easteal</i>	
Introduction	49
The Spread of <i>Bufo marinus</i>	50
The Introductions	50
The Australian Range Expansion	52
Genetic Variation in the Introduced Populations	58
The Data	58
Genetic Variability	58
Effective Population Size	62
Dispersal, Gene Flow, and Neighborhood Size	63
The Genetic Effects of Range Expansion	64
Geographical Patterns of Variation	74
Conclusion	81
References	82
4. Evolution by Social Selection	85
<i>Shozo Yokoyama</i>	
Introduction	85
Concept of Social Selection	86
Evidence for Social Selection	88
Multiple Neurofibromatosis	88
Huntington Disease	89
Mental Retardation	90
Schizophrenia	91
Social Selection Models	91
Autosomal Genes	92

X-Linked Genes	103
Random Genetic Drift and Variable Selection Intensity	112
Maternal Effects	115
DNA Polymorphism and Social Selection	117
Discussion	118
Summary	121
References	122
5. The Influence of Taxonomic Method on the Perception of Patterns of Evolution	127
<i>Andrew B. Smith and Colin Patterson</i>	
Introduction	127
The Nature of Taxa	129
Why Nonmonophyletic Groups Are Not Real Taxa	131
Paraphyletic Taxa as Natural Adaptively Unified Groups ..	131
Nonmonophyletic Groups as Valid Samples of Species-Level Processes	132
The Red Queen Hypothesis	134
Taxon Duration Is Proportional to the Number of Species Included in the Taxon	135
Taxonomic Extinctions under Consideration Are Largely Artefactual	139
The Red Queen as Systematist: The Probability That a Taxonomist Will Split a Group Is Inversely Proportional to the Number of Species in That Group	142
Decrease in Extinction Rate through Time	142
Periodicity of Extinction	143
Generic Data and Lagerstätten	147
Species Diversity	148
What Do Fossil Species Sample?	152
Analysis of Gaps	153
Summary	161
Appendix 1: Families, Genera, and Species of Echinoderm Listed as Extinct in Sepkoski's Compendia That Have Been Checked	161
Families	162
Genera and Species	169
Appendix 2: Families, Genera, and Species of Fishes That Have Been Checked	181

Families	181
Genera and Species	191
References	204
References for Appendix 1	207
References for Appendix 2	209
6. Genetic Diversity in Nature: Patterns and Theory	217
<i>Eviatar Nevo</i>	
The Problem	217
A Promising Solution	219
The Evidence	220
Microgeographic Stress Studies in the Field and Laboratory	221
Macrogeographic Regional Studies across Israel	224
Macrogeographic Global Studies of Protein Diversity Worldwide	228
The Theory	230
How Much of the Genetic Diversity in Nature Is Adaptive?	230
The Genetic-Environmental Methodology: Weaknesses and Strengths	234
Does the Evidence of Molecular Polymorphism in Nature Support the Neutral Theory of Molecular Evolution? ..	235
Patterns of Genetic Diversity and Their Presumed Physiological Function	236
Maintenance of Polymorphisms	237
The Matching of Evidence and Selective Theoretical Models	238
Conclusions and Prospects	240
Summary	242
References	243
7. Challenges to the Evolutionary Synthesis	247
<i>Richard M. Burian</i>	
Introduction	247
How Should We Interpret the Synthesis	250
Biased Variation, Internal Dynamics, and Evolutionary Conservatism	252

Hierarchy	255
Unifying Theories	259
An Optimistic Conclusion	264
References	267

8. Evolution and Genetics of Epigeal and Cave <i>Astyanax</i> <i>fasciatus</i> (Characidae, Pisces): Support for the Neutral Mutation Theory	271
--	-----

Horst Wilkens

Introduction	271
Taxonomy and Distribution of Epi- and Hypogean <i>Astyanax</i> <i>fasciatus</i>	272
The Epigeal Fish	272
The Hypogean Fish	272
Preadaptive Traits	276
Lateral Line System	276
Auditory Capacity	278
Olfactory Organ	279
Sexual Behavior	279
Regressive Traits	280
Eye	280
Pineal Organ	302
Color Pattern	303
Scales	308
Aggressive Behavior	309
Schooling Behavior	312
Activity Control	312
Alarm Substance and Fright Reaction	316
Light Sensitivity and Phototactic Response	318
Constructive Traits	321
Gustatory Equipment	321
Food Localization and Feeding Behavior	324
Metabolic Rates	326
Egg Yolk Content and Early Development	331
Genetics and the Evolution of Complex Features	334
General Principles of Polygene Manifestation in <i>Astyanax</i> <i>fasciatus</i>	334
Minimum Number of Genetic Factors	335
Evolutionary Significance	339

The Phylogenetic Age of the Hypogean Populations	343
The Speciation Process of Troglotic <i>Astyanax fasciatus</i>	344
Speciation and Hybridization	344
Allozyme Variation	347
The Neutral Mutation Theory and Its General Importance in Evolution	348
General Principles of the Neutral Mutation Theory	348
Recent Criticisms of the Neutral Mutation Theory	352
General Evolutionary Significance of Regressive Evolutionary Principles	354
Summary	358
References	359
9. Random Walk and the Biometrics of Morphological Characters	369
<i>Fred L. Bookstein</i>	
Introduction	369
The Structurelessness of Random Walks	371
The Range Statistic x for Symmetric Random Walk	376
Example: Temporal Change in a Miocene Stickleback	383
Reduced Speeds	385
Chronological Clustering	390
Concluding Remarks	392
Summary	396
References	398
Index	399
