Contents

3-13. Concentration Dependence of the Chemical Potential	67	5-3. Osmotic Pressure in a Liquid	115
3-14. Factors on which the Number of Microstates Can Depend; Extensive Variables and Generalized Forces	69	5-4. Some Clinical Examples	116
3-15. Systems that Can Exchange Volume	69	5-5. Volume Transport Through a Membrane	119
3-16. The General Thermodynamic Relation	71	5-6. Solute Transport	122
3-17. Gibbs Free Energy	71	5-7. The Artificial Kidney	123
3-18. Transformation of Randomness into Order	73	5-8. Volume Flow in a Large Pore	124
3-19. Microstates of an Ideal Gas	74	5-9. Solute Transport in a Large Pore	126
4. Transport in an Infinite Medium	87	5-10. Reflection Coefficient	131
4-1. Flow, Flux, and Continuity	87	5-11. The Effect of Pore Walls on Diffusion	132
4-2. Solvent Drag	90	5-12. Example; Solute Flow when There Is No Reflection	132
4-3. Brownian Movement	91	5-13. The Kidney; Glomerular Filtration	136
4-4. Motion in a Gas: Mean Free Path and Collision Time	92	5-14. Pores with Different Radii	139
4-5. Motion in a Liquid	93	5-15. Pressure Relationships when the Solute Is Subject to an External Force	139
4-6. Diffusion; Fick's First Law	95	5-16. The Transport Equations for a Single-file Pore	141
4-7. The Einstein Relationship Between Diffusion and Viscosity	96	5-17. Ion Concentrations Inside and Outside a Cell	145
4-8. Fick's Second Law of Diffusion	98	5-18. Donnan Equilibrium	145
4-9. A General Solution for the Particle Concentration as a Function of Time	102	5-19. Ion Movement in Solution; The Nernst-Planck Equation	147
4-10. Diffusion as a Random Walk	104	5-20. Constant Charge in the Presence of Leakage Currents and a Constant Field in the Membrane; The Goldman Equation	148
5. Transport Through Membranes	111	5-21. The Chemical Potential of a Solution	151
5-1. Membranes	111	5-22. The Statistical Mechanics of Fluid Pressure	154
5-2. Osmotic Pressure in an Ideal Gas	112		

6. Electrical Properties of Nerves	163	6-23. Analogues between diffusion and Electrostatics; End effects	206
6-1. Properties of Nerves	163	7. The Electrocardiogram	219
6-2. Coulomb's Law; Superposition; The Electric Field	164	7-1. Electrical Properties of Myocardial Cells	219
6-3. Gauss's Law	165	7-2. The Nonconducting Model; The Potential Due to a Dipole	221
6-4. Potential Difference	169	7-3. Dipole Moment of the Heart as a Function of Time	224
6-5. Conductors	170	7-4. The Electrocardiographic Leads	226
6-6. Capacitance	171	7-5. Some Electrocardiograms	229
6-7. Dielectrics	171	7-6. Why Lead I Is Not Exactly Horizontal	231
6-8. Current; Ohm's Law	173	7-7. Why the Nonconducting Model Works	233
6-9. A Microscopic Model of Resistance	174	7-8. Nonuniform Conductivity; The Effect of Air in the Lungs or Blood in the Heart	233
6-10. Conductivity; Energy Dissipation	176	8. Feedback and Control	239
6-11. The Application of Ohm's Law to Simple Circuits	177	8-1. Steady State Relationships Between Variables	240
6-12. Charge Distribution in the Resting Nerve Cell	178	8-2. Determining the Operating Point	241
6-13. Leakage Current Across the Cell Membrane	180	8-3. Regulation of a Variable; Open Loop Gain	241
6-14. Resistance Along the Axon	182	8-4. Approach to Equilibrium	243
6-15. The Nerve Impulse; Transmission Across a Synapse	183	8-5. A Feedback Loop with One Time Constant	244
6-16. The Application of the Circuit Theorems (Kirchhoff's Laws) to a Segment of Axon	184	8-6. A Feedback Loop with Two Time Constants	247
6-17. Electrotonus	187	8-7. A Feedback Loop with a Time Constant and a Fixed Time Delay	248
6-18. The Hodgkin-Huxley Model for Membrane Current	189	8-8. Oscillations in a Feedback Loop; A Summary	250
6-19. Voltage Changes in a Clamped Axon	194		
6-20. The propagating Nerve Impulse	194		
6-21. Properties of Myelinated Fibers and Saltatory Conduction	198		
6-22. Membrane Capacitance	203		

Contents

8-9. Example: Cheyne-Stokes Respirations	250	9-13. Pulses and Fourier Integrals	296
8-10. Example: Pupil Size	251	9-14. The Energy Spectrum of a Pulse; Parseval's Theorem	299
8-11. Example: Anerobic Glycolysis in Yeast	251	9-15. The Autocorrelation Function of a Pulse and Its Relation to the Energy Spectrum	301
8-12. Example: Control of Limb Position	252	9-16. The Power Spectrum of Random Signals	303
8-13. Example: Glucose Tolerance Test	255	9-17. The Power Spectrum of the Electroencephalogram	303
8-14. Proportional, Derivative, and Integral Control	260	9-18. Frequency Response of a Linear System	307
8-15. Nonlinear Control; The Human Menstrual Cycle	262	9-19. Effect of Transfer Functions with Different Frequency Responses	309
9. Signal Analysis	273	9-20. Two-Dimensional Image; CT Scanning	312
9-1. The Method of Least Squares; Polynomial Regression	273	10. Atoms and Light	321
9-2. Nonlinear Least Squares	276	10-1. The Nature of Light; Waves versus Photons	321
9-3. The Presence of Many Frequencies in a Periodic Signal	277	10-2. Atomic Energy Levels and Atomic Spectra	323
9-4. Fourier Series	278	10-3. Molecular Energy Levels	325
9-5. The Power Spectrum	282	10-4. Biological Examples of Emission, Absorption, and Fluorescence	328
9-6. Fourier Series for Discrete Data	283	10-5. Spectra of Liquids and Solids; Blackbody Radiation	331
9-7. Pitfalls of Discrete Sampling; Aliasing and False Periodicities	285	10-6. Radiative Heat Loss by the Human Body	335
9-8. Correlation Functions	286	10-7. Thermography	336
9-9. The Autocorrelation Function and the Power Spectrum	288	10-8. The Biological Effects of Ultraviolet Radiation from the Sun	338
9-10. Noise	290	10-9. Photometry	341
9-11. Use of the Correlation Function to Detect a Signal in the Presence of Noise	290	10-10. Some Properties of the Eye; Quantum Effects in Dark-Adapted Vision	345
9-12. Reproducing a Periodic Signal with the Cross-correlation Function; The Delta Function	294		

10-11. The Electromagnetic Nature of Light	349	11-14. Fluoroscopy	408
10-12. Plane Waves	350	11-15. Diagnostic Radiology	408
10-13. Polarization	350	11-16. Mammography	412
10-14. The Generation of Polarized Light	353	11-17. Electrostatic Image Detection: Xeroradiography, Electron Radiography, and Ionoradiography	413
10-15. Polarization by Selective Absorption (Dichroism)	355	11-18. Scintillation Detectors	414
10-16. How Polarization Affects the Speed of Light in a Crystal; Birefringence	356	11-19. Gas Counters	416
10-17. Retarder Plates	357	11-20. Semiconductor and Thermoluminescent Detectors	418
10-18. Gout and Pseudogout	359	11-21. Tomography	418
10-19. Rotation of the Direction of Polarization; Optical Activity	359	11-22. Computed Tomography	419
10-20. Absorption and Emission of Radiation	361	11-23. Biological Effects of X-Rays	424
10-21. Emission Lifetime and Line Width	362	11-24. Therapeutic Radiology	429
10-22. Line Width in Absorption	364		
10-23. Electron Spin Resonance	365	12. Nuclear Physics and Nuclear Medicine	443
11. X-Rays	379	12-1. Nuclear Systematics	444
11-1. Production of X-Rays	379	12-2. Nuclear Decay: Decay Rate and Half-Life	447
11-2. Gamma Rays	383	12-3. Gamma Decay and Internal Conversion	448
11-3. Interaction of Photons with Matter	383	12-4. Beta Decay and Electron Capture	449
11-4. Cross Section	384	12-5. Calculating the Absorbed Dose from Radioactive Nuclei Within the Body	453
11-5. Compton Scattering	386	12-6. Activity and Cumulated Activity	454
11-6. The Photoelectric Effect	392	12-7. Mean Energy Emitted per Unit Cumulated Activity	458
11-7. Pair Production	394	12-8. Calculation of the Absorbed Fraction	460
11-8. Attenuation of Electromagnetic Radiation	395	12-9. Radiopharmaceuticals	464
11-9. Photon Absorption	402	12-10. A Sample Dose Calculation	467
11-10. Buildup	404	12-11. Detectors for Nuclear Medicine	467
11-11. Dose; The Rad	405		
11-12. Exposure; The Roentgen	406		
11-13. Film as an X-Ray Detector; Screens and Grids	406		

Contents

12-12. Interaction of Heavy Charged Particles with Matter	471	Appendix D. Some Integrals of Sines and Cosines	505
12-13. Range-Energy Relationship for Heavy Charged Particles	475	Appendix E. Linear Differential Equations with Constant Coefficients	507
12-14. Energy Loss of Electrons	477	Appendix F. The Mean and Standard Deviation	513
12-15. Specific Ionization; The Bragg Curve. Linear Energy Transfer	477	Appendix G. The Binomial Probability Distribution	517
12-16. Biological Effects of Different Radiations	478	Appendix H. The Gaussian Probability Distribution	521
12-17. A Model Relating the Effects of Different Radiations	479	Appendix I. The Poisson Distribution	525
12-18. Heavy Particle Therapy	482	Appendix J. Integrals Involving e^{-ax^2}	529
12-19. Mass Spectroscopy	482	Appendix K. Spherical and Cylindrical Coordinates	531
12-20. Nuclear Reactions and Q Values	485	Appendix L. The Poisson Distribution of Events Occurring Randomly at a Constant Average Rate	533
12-21. Nuclear Magnetic Resonance	487	Appendix M. Joint Probability Distributions	535
12-22. Autoradiography	487	Appendix N. Partial Derivatives	537
Appendix A. Plane and Solid Angles	497	Appendix O. Some Fundamental Constants	539
Appendix B. Properties of Exponents and Logarithms	499	Appendix P. Conversion Factors	541
Appendix C. Taylor's Series	501	Index	543
