

# Contents

<i>Preface</i>	<i>xi</i>
<i>Acknowledgments</i>	<i>xiii</i>
<b>1. The cell membrane as a functional Mobius strip</b>	<b>1</b>
introduction	1
The cell membrane as the prototype for the Mobius strip	2
Micelles, semipermeable membranes, and calcium ion fluxes	3
Calcium ions passing through the cell constitute the biologic flow of energy	3
The evolution of multicellularity	4
Epigenetic inheritance	6
Conclusions	7
References	8
Further reading	9
<b>2. Consciousness, the “missing link” between physics and physiology</b>	<b>11</b>
<b>3. The unicell as the crucible for consciousness as Quantum Entanglement</b>	<b>17</b>
introduction	17
“Life is that Which Can Mix Oil and Water”—Robert Frost	18
The vector formed by the Big Bang	20
Observer-observed?	21
Entanglement forms “knots”	22
Cryptochrome, FAD, and magnetoreception	22
Skepticism about Quantum Biology due to decoherence	23
Discussion	23
References	26
<b>4. Cybernetics as a conversation with the Cosmos</b>	<b>27</b>
Prelude	27
introduction	27
The origin of life as our Cybernetic “dialog” with the Cosmos	29
Big Bang	33
Physiology as Ross Ashby’s Black Box of Cybernetics	33
(Non)conscious or (sub)conscious Cybernetics	34

On the Cybernetics of auto-engineering	35
Discussion	37
Acknowledgment	38
References	39
Further reading	40
<b>5. Disambiguation, evolution, and the topology of consciousness</b>	<b>41</b>
Introduction	41
The homology between evolution and knots	42
Circles, knots, cells, and memory	44
DNA knots, Homeobox genes, and cell-cell signaling	45
Preadaptations, lipids immersed in water, and knots	45
The deep significance of the homology between knots and evolution	47
The metaphysics of knots	47
Left-right brain as the resolution of Quantum Mechanics in biology: A hypothesis	48
Discussion	49
Reference	50
<b>6. On the evolution of evolution</b>	<b>51</b>
<b>7. The continuum from physics to cosmology</b>	<b>57</b>
Introduction	57
The Big Bang of the Singularity gave rise to both the physical and biologic realms	59
A feasible pathway for quantum evolutionary development through cell-cell interactions	59
Mayr's proximate and ultimate causes of evolution	60
Comparing apples with apples	62
Epigenetic inheritance infers the primacy of the unicellular state	63
Pauli Exclusion Principle: Homolog for the First Principles of Physiology	64
Nonlocality in physics and biology	65
Coherence as Schrodinger wave collapse	67
Heisenberg Uncertainty Principle facilitates biologic ambiguity	68
Physiology as recursive fractals	69
The narrative version of vertebrate evolution	72
Consciousness as the aggregate of the inanimate to the animate	73
Conclusions	73
References	74

<b>8. Quantum Mechanics predicts evolution</b>	<b>75</b>
Introduction	75
Quantum Mechanics and origins and causation in biologic evolution	77
The predictive value of a Quantum Mechanical approach to evolution	79
The unicell-multicell approach predicts the iterative evolution of niche construction: A holistic approach	80
The forward-directed continuum of evolution predicts the foundational role of Quantum Mechanics	81
Physiology as a homolog for quantum coherence?	81
The cytoskeleton as the homolog for self-organization and consciousness	81
Discussion	83
References	84
<b>9. Goldilocks effect as local paracrine control of homeostasis and endocrinology</b>	<b>87</b>
Introduction	87
Micro- to macroevolution	87
The phylogenetic history of the thyroid	90
An evolutionary vertical integration of the phylogeny and ontogeny of the thyroid	92
Wolff's Law and bone remodeling	94
Goodpasture's syndrome	94
Salinity and the vitamin D receptor	95
References	97
<b>10. The atom and cell are homologous point sources in a quantum world</b>	<b>99</b>
Introduction	99
Biology and physics	101
On the origin of complex physiology	107
The evolution of visceral organs	110
Mechano-transduction and evolutionary fundamentals	111
Biologic time as artifact	115
In conclusion—The cell as the first niche construction	116
References	118
<b>11. The Vitruvian Cell</b>	<b>119</b>
Introduction	119
da Vinci's Vitruvian Man	119

Math, geometry, biology, and metaphysics	121
Leonardo da Vinci	122
Homology between the cell and a crossword puzzle	122
<b>12. Implicate and Explicate Orders as unconscious and conscious</b>	<b>125</b>
Introduction	125
The Periodic Table of Elements and You	127
The environment gave rise to endothermy	131
The Periodic Table and Evolutionary Biology are diachronic vectors of the Big Bang	134
Information Theory meets Informatics	137
Truth be told	138
There is only space, there is no time	139
A novel prediction of Consciousness as the Singularity	140
The vertical integration of gravity, chemistry, and biology as Consciousness	141
Biology and chemistry as vectoral fractals of the Big Bang	143
Terminal Addition and Phantom Limb as "Proof of Principle" for Physiology as our Implicate Order	144
Conclusions	144
References	145
<b>13. The latticework of both the Cosmos and physiology</b>	<b>149</b>
Introduction	149
Nucleosynthesis—First 36 Elements, all relevant to physiology with the exception of iodine, 53, which became adapted by the thyroid	149
Evolutionary vertical integration of the phylogeny and ontogeny of the thyroid	151
Symbiogenesis, Terminal Addition, and cell-cell signaling	152
Gravity is necessary for life and forms the basis for the lattice	153
Synchronicity as a product of latticework	153
Phantom Limb, Terminal Addition, and latticework	153
Quantum Mechanics and latticework: Quantum Chromodynamics theory	154
Using the "reverse-evolution" approach to emergence led from Symbiogenesis to Quantum Entanglement/nonlocalization: But where did QM evolve from? Particle Physics, including QCD theory as the common lattice work of the Cosmos	154
References	155
