

CONTENTS

1. Introduction **1—12**

Background of Selection, Functions of Essential Elements, Trace Elements, Functions of Trace Elements, Newest Essential Elements, Synergism and Antagonism.

2. Atoms and Molecules **13—43**

Atoms, Atoms and Elements, Molecules and Compounds, Chnops, Structure of an Atom, Isotopes, Electrons and the Properties of the Atom, Atoms of Life, Chemical Bonds, Ionic Bonds, Covalent Bonds, Secondary Bonds, Vander Waals Forces, Hydrophobic Bonds, Constituents of Living Material, Elements Found in Living Material, Molecules, Chemical Reactions, Buffers.

3. Polysaccharide **44—101**

Glycosubstances and Glycopolymers, Structures, Nomenclature and Abbreviations, Polysaccharides Polydispersity: Molecular Weight Averages, Solution Properties and Characterization Methods, Measurement of Molecular Weight Averages and Molecular Weight Distribution, Polysaccharide Conformation in Solution, Imaging of Polysaccharides: X-ray Fibre Diffraction and Electron Microscopy, Polysaccharide Rheology, Classification of Polysaccharides, Cell Wall, Storage Polysaccharides, Polysaccharide Identification or Fingerprinting, Potential for Biotechnology, Strategies for Biotechnology, Use of Enzymes in Processes: General Considerations, Raw Material Modification: Altered Metabolism, Choosing a Project, Steps in Biotechnology: Producing an Enzyme, Time Scales and Costs.

4. Energy Production **102—128**

Biological Work Requires Energy, Occurrence and Properties of ATP and ADP, Measuring Energy, Laws of Thermodynamics, Metabolic Reactions Involve Energy Transformations, Oxidative Respiration, Glycolysis, Oxidation of Pyruvate, Krebs Cycle, Electron Transport Chain, Chemiosmosis, Living without Oxygen: Fermentation.

5. Osmolality **129—152**

Theoretic Considerations, Definitions and Units, Real versus Ideal Osmolality, Measurement of Osmolality, Colligative Relationships, Osmometers, Calibration, Measurement Artifacts, Measurement of Differential Osmolality—Colloid Osmotic Pressure, Theoretic Considerations, Colloid Osmometers, Clinical Applications of Osmolality Measurement, Plasma Osmolality, Urine Osmolality, Osmolality in Disease, Miscellaneous, Clinical Applications of Colloid Osmotic Pressure, Intercompartmental Translocation of Fluid, COP Versus Total Protein Measurement, Prediction of Pulmonary Edema, Factors Affecting COP Measurements.

6. Ergot Alkaloids **153—181**

Ergot, Practical Importance, Sources, Chemistry, Molecular Flexibility of Ergopeptines, Biogenesis, Tryptophan, Dimethylallyltryptophan Synthetase, Dimethylallyltryptophan N-methyltransferase, Clavines, Cytochrome P-450, Clavicipitic Acid, Ergopeptines, Physiology of Formation, Growth Phases, Mechanism of Sucrose Utilization, Differentiation, Proteolytic Activity, Cell Walls, Oleosomes, Cultivation Conditions, Location of Alkaloid Biosynthesis, Cell-Free Biosynthesis, Physiological Role, Strain Degeneration, Strain Improvement, Scale-Up Problems, Conclusions.

7. Biotechnology of Nucleotides **182—197**

Utility of Oligonucleotides in Biotechnology, Development of Oligonucleotide Synthesis, History or Solid-phase Chemistry, Current Methods in DNA Synthesis, Coupling Methods, Solid Supports, Deblocking Agents, Workup, Manual, Semi-Automatic and Automatic Synthesis, Manual Synthesis, Semi-Automatic Synthesis, Automatic Synthesis, History of Automated Chemical Synthesis, Principles of Automatic DNA Synthesis, Controller, Reagent and Solvent Delivery System, Servo-Mechanical Valves,

Solid-Phase Reactor, Advantages of Automatic Synthesis, Limitations Imposed by Automatic Procedures, Economics of Gene Fragment Synthesis, Characterization of Oligonucleotides, Future Developments in Automated Gene Fragment Synthesis, RNA Fragment Synthesis, New Chemical Methodology, Longer Fragments, Integrated Synthesis and Purification, Reduced Operation Costs, Analytical Feedback, Automated Sequencing.

8. Isolation of Enzyme **198—257**

Sources and Location of Enzymes, Enzyme Extraction, Disruption of Animal and Plant Tissue, Disruption of Microbial Cells, Aqueous and Solvent Extraction, Purification of Enzymes, Removal of Lipids, Removal of Nucleic Acids, Purification by Differential Solubility, Purification by Chromatographic Methods, Electrophoresis and Ultracentrifugation, Practical Aspects of Enzyme Purification, Finishing Operations, Desalting, Concentration of Enzymes, Quality Control, Storage, Biotechnological Aspects of Enzyme Purification Process Design, Integration of Fermentation and Recovery Processes, Scale-Up, Continuous Enzyme Purification, Simultaneous Enzyme Purification, Computer Control, Biosafety in Industrial Isolation and Purification of Enzymes, Future Prospects.

9. Immunological Reactions **258—292**

Reactions of Antibodies with Haptens, Antibody Valence and Affinity, Affinity Measurement, Equilibrium Dialysis, Affinity Heterogeneity: Average Affinity, Specificity and Affinity, Physicochemical Basis of Hapten-Antibody Binding, Forces involved in Antigen-Antibody Reactions, Van Der Waals Forces, Electrostatic Forces, Hydrogen Bonds, Hydrophobic Bonds, Conclusions, Influence of Physicochemical Conditions on Antigen-Antibody Reactions, Effects of pH and Ionic Strength, Effects of Temperature, Thermodynamics, Kinetics, Reactions of Antibodies with Macromolecules, Valence and Complexity of Protein and Polysaccharidic Antigens, Affinity and Avidity, Classification of Antigen-Antibody Reactions, Primary Methods, Secondary Methods, Tertiary Methods, Direct Binding Tests, Methods that Employ Precipitation of Antigen-Antibody Complexes, Fluorometric Methods, Methods Based on Size Differences between Bound and Free Antigen, Radioimmunoassays, Immunofluorescence, Immunoprecipitation,

Liquid Precipitation, Prozone Phenomenon, Gel Precipitation, Antigen-Antibody Reactions using Cellular or Particulate Antigens, Agglutination Reactions, Neutralization Reactions, Reactions using Complement.

10. Biotechnology of Radiation

293—307

Nature of Radiation, Cosmic Radiation, Terrestrial Radiation, Man-made Radiations, Units, Damage from Ionising Radiations to Living Organisms, Damage at the Molecular Level, Repair Processes at the Molecular Level, Radiation Induced Damage and Repair at the Level of Tissues, Genetic Effects and Radiation Carcinogenesis.
