|-----------------------------------------------------------------|-----------|
| <i>List of boxes</i>                                            | ix        |
| <i>Preface</i>                                                  | xi        |
| <b>1 What is Genetic Variation?</b>                             | <b>1</b>  |
| Deoxyribose nucleic acid: DNA                                   | 1         |
| Ribose nucleic acid: RNA                                        | 5         |
| What is the genetic code?                                       | 6         |
| Protein structure                                               | 7         |
| So what about chromosomes?                                      | 8         |
| How does sexual reproduction produce variation?                 | 11        |
| Mitochondrial DNA                                               | 16        |
| Further reading                                                 | 18        |
| <b>2 How Can Genetic Variation be Measured?</b>                 | <b>19</b> |
| DNA sequence variation                                          | 19        |
| DNA fragment size variation                                     | 32        |
| <i>Restriction fragment length polymorphisms (RFLPs)</i>        | 32        |
| <i>Variable number tandem repeats (VNTR)</i>                    | 34        |
| <i>DNA fingerprinting</i>                                       | 38        |
| <i>Random amplified polymorphic DNA (RAPD)</i>                  | 38        |
| <i>Amplified fragment length polymorphism (AFLP)</i>            | 39        |
| Protein variation                                               | 41        |
| Phenotypic variation                                            | 45        |
| Further reading                                                 | 46        |
| <b>3 Genetic Structure in Natural Populations</b>               | <b>47</b> |
| What is a stock?                                                | 47        |
| How are allele frequencies estimated?                           | 48        |
| What is the relationship between alleles and genotypes?         | 49        |
| How do allele frequencies change over time?                     | 51        |
| How does population structure arise?                            | 52        |
| How are genetic markers used to define population structure?    | 53        |
| Levels of genetic differentiation in aquatic organisms          | 56        |
| Mixed stock analysis (MSA)                                      | 68        |
| Conservation genetics                                           | 70        |
| Further reading                                                 | 71        |
| <b>4 Genetic Considerations in the Hatchery</b>                 | <b>73</b> |
| Is there evidence of loss of genetic variation in the hatchery? | 75        |

---

|                                                                           |            |
|---------------------------------------------------------------------------|------------|
| How do hatcheries affect heterozygosity?                                  | 77         |
| How can we use genetic markers to identify hatchery-produced individuals? | 81         |
| <i>Identification to family level</i>                                     | 81         |
| <i>Identification to population level</i>                                 | 81         |
| Genome mapping                                                            | 82         |
| <i>How is a genome mapped?</i>                                            | 83         |
| <i>How do we carry out linkage analysis?</i>                              | 85         |
| <i>The SALMAP project</i>                                                 | 88         |
| Identification of diseases                                                | 88         |
| Further reading                                                           | 89         |
| <br>                                                                      |            |
| <b>5 Artificial Selection in the Hatchery</b>                             | <b>91</b>  |
| Qualitative traits                                                        | 91         |
| Quantitative traits                                                       | 95         |
| What kinds of traits are important?                                       | 96         |
| Variance of a trait                                                       | 97         |
| How can we estimate narrow-sense heritability?                            | 99         |
| Correlated traits                                                         | 104        |
| What types of artificial selection are there?                             | 105        |
| What about realised heritabilities?                                       | 108        |
| Setting up a breeding programme                                           | 108        |
