
CONTENTS

Contributors	xiii
Preface	xv
1. Use of Least-Squares Techniques in Biochemistry	1
<i>Michael L. Johnson</i>	
I. Update	1
II. Introduction	2
III. Nonlinear Least-Squares	4
IV. Why Use NLLS Analysis Procedures?	6
V. When to Use NLLS Analysis Procedures	7
VI. What Confidence Can Be Assigned to Results of NLLS Analysis?	14
VII. Conclusions	20
References	22
2. Parameter Estimates from Nonlinear Models	23
<i>Donald G. Watts</i>	
I. Introduction	24
II. Discussion	35
References	36
3. Analysis of Residuals: Criteria for Determining Goodness-of-Fit	37
<i>Martin Straume and Michael L. Johnson</i>	
I. Update	37
II. Introduction	38
III. Scatter Diagram Residual Plots	40
IV. Cumulative Probability Distributions of Residuals	41
V. χ^2 Statistic: Quantifying Observed Versus Expected Frequencies of Residual Values	43
VI. Kolmogorov-Smirnov Test: An Alternative to the χ^2 Statistic	44
VII. Runs Test: Quantifying Trends in Residuals	45
VIII. Serial Lag _n Plots: Identifying Serial Correlation	47
IX. Durbin-Watson Test: Quantitative Testing for Serial Correlation	47

X. Autocorrelation: Detecting Serial Correlation in Time Series Experiments	49
XI. χ^2 Test: Quantitation of Goodness-of-Fit	50
XII. Outliers: Identifying Bad Points	51
XIII. Identifying Influential Observations	52
XIV. Conclusions	53
References	54
 4. Monte Carlo Method for Determining Complete Confidence Probability Distributions of Estimated Model Parameters	55
<i>Martin Straume and Michael L. Johnson</i>	
I. Update	55
II. Introduction	56
III. Monte Carlo Method	58
IV. Generating Confidence Probability Distributions for Estimated Parameters	58
V. Implementation and Interpretation	60
VI. Conclusion	65
References	66
 5. Effects of Heteroscedasticity and Skewness on Prediction in Regression: Modeling Growth of the Human Heart	67
<i>Robert D. Abbott and Howard P. Gutgesell</i>	
I. Introduction	67
II. Example from Modeling Growth of the Human Heart	68
III. Methods of Estimation	70
IV. Discussion	78
References	79
 6. Singular Value Decomposition: Application to Analysis of Experimental Data	81
<i>E. R. Henry and J. Hofrichter</i>	
I. Update	82
II. Introduction	83
III. Definition and Properties	91
IV. Singular Value Decomposition of Matrices Which Contain Noise	93
V. Application of Singular Value Decomposition to Analysis of Experimental Data	107
VI. Simulations for a Simple Example: The Reaction $A \rightarrow B \rightarrow C$	120
VII. Summary	133
References	138

7. Irregularity and Asynchrony in Biologic Network Signals	141
<i>Steven M. Pincus</i>	
I. Update	142
II. Introduction	142
III. Quantification of Regularity	146
IV. Implementation and Interpretation	148
V. Representative Biological Applications	152
VI. Relationship to Other Approaches	154
VII. Mechanistic Hypothesis for Altered Regularity	158
VIII. Cross-ApEn	158
IX. Toward More Faithful Network Modeling	166
X. Spatial (Vector) ApEn	167
XI. Summary and Conclusion	169
References	170
8. Distinguishing Models of Growth with Approximate Entropy	173
<i>Michael L. Johnson, Michelle Lampl, and Martin Straume</i>	
I. Update	173
II. Introduction	174
III. Definition and Calculation of ApEn	175
IV. Modifications of ApEn Calculation for this Application	176
V. Growth Models	177
VI. Expected Model-Dependent Distribution of ApEn	178
VII. Example of this Use of ApEn	179
VIII. Conclusion	182
References	184
9. Application of the Kalman Filter to Computational Problems in Statistics	187
<i>Emery N. Brown and Christopher H. Schmid</i>	
I. Introduction	187
II. Evaluating Gaussian Likelihood Using the Kalman Filter	189
III. Computing Posterior Densities for Bayesian Inference Using the Kalman Filter	192
IV. Missing Data Problems and the Kalman Filter	193
V. Extensions of the Kalman Filter Algorithm	196
References	196
10. Bayesian Hierarchical Models	199
<i>Christopher H. Schmid and Emery N. Brown</i>	
I. Introduction	199
II. The Gaussian Model	203
III. Computation	208

IV. Example: Meta-Regression	211
V. Example: Saltatory Model of Infant Growth	216
VI. Incorporation of Variance Components	219
VII. Model Checking	220
VIII. Conclusion	221
References	222
 11. Mixed-Model Regression Analysis and Dealing with Interindividual Differences	 225
<i>Hans P. A. Van Dongen, Erik Olofson, David F. Dinges, and Greg Maislin</i>	
I. Introduction	226
II. Experiment and Data	227
III. Repeated-Measures ANOVA	228
IV. Mixed-Model Regression Analysis	235
V. An Alternative Linear Mixed-Effects Model	241
VI. Nonlinear Mixed-Model Regression Analysis	245
VII. Correlation Structures in Mixed-Model Regression Analysis	253
VIII. Conclusion	254
References	255
 12. Distribution Functions from Moments and the Maximum-Entropy Method	 257
<i>Douglas Poland</i>	
I. Introduction	257
II. Ligand Binding: Moments	259
III. Maximum-Entropy Distributions	265
IV. Ligand Binding: Distribution Functions	273
V. Enthalpy Distributions	279
VI. Self-Association Distributions	287
References	291
 13. The Mathematics of Biological Oscillators	 293
<i>G. Bard Ermentrout</i>	
I. Introduction	293
II. Oscillators and Excitability	294
III. Perturbations of Oscillators	299
IV. Coupled Oscillators	304
References	308
 14. Modeling of Oscillations in Endocrine Networks with Feedback	 309
<i>Leon S. Farhy</i>	
I. Introduction	309
II. General Principles in Endocrine Network Modeling	310

III. Simulating the Concentration Dynamics of a Single Hormone	312
IV. Oscillations Driven by a Single System Feedback Loop	315
V. Networks with Multiple Feedback Loops	330
VI. Summary and Discussion	333
References	336
 15. Boundary Analysis in Sedimentation Velocity Experiments	 337
<i>Walter F. Stafford</i>	
I. Update	338
II. Introduction	338
III. Methods of Data Acquisition	340
IV. Measurement of Transport in Analytical Ultracentrifuge	340
V. Traditional Methods of Analysis	341
VI. Transport Method	342
VII. Smoothing and Differentiating	344
VIII. Computation of Apparent Sedimentation Coefficient Distribution Functions	349
IX. Weight Average Sedimentation Coefficient from $g(s^*)$	354
X. Methods of Correcting Distribution Functions for Effects of Diffusion	357
XI. Discussion	358
References	358
 16. Statistical Error in Isothermal Titration Calorimetry	 361
<i>Joel Tellinghuisen</i>	
I. Update	361
II. Introduction	364
III. Variance-Covariance Matrix in Least Squares	366
IV. Monte Carlo Computational Methods	372
V. Van't Hoff Analysis of $K^o(T)$: Least-Squares Demonstration	373
VI. Isothermal Titration Calorimetry	377
VII. Calorimetric Versus Van't Hoff ΔH^o from ITC	390
VIII. Conclusion	394
References	397
 17. Physiological Modeling with Virtual Cell Framework	 399
<i>James C. Schaff, Boris M. Slepchenko, and Leslie M. Loew</i>	
I. Update	400
II. Introduction	401
III. Modeling Abstractions for Cellular Physiology	402
IV. Application to Existing Model	412
V. Conclusions	418
References	424

18. Fractal Applications in Biology: Scaling Time in Biochemical Networks	425
<i>F. Eugene Yates</i>	
I. Update	426
II. Introduction	427
III. Fractal Morphology in Mammals: Some Branchings	430
IV. Chaos in Enzyme Reactions	437
V. Practical Guide to Identification of Chaos and Fractals in Biochemical Reactions	438
VI. Summary, or What Does It All Mean?	440
VII. Glossary	442
References	458
 19. Analytical Methods for the Retrieval and Interpretation of Continuous Glucose Monitoring Data in Diabetes	 461
<i>Boris Kovatchev, Marc Breton, and William Clarke</i>	
I. 2010 Update of Developments in the Field	462
II. Introduction	463
III. Decomposition of Sensor Errors	466
IV. Measures of Average Glycemia and Deviation from Target	467
V. Risk and Variability Assessment	469
VI. Measures and Plots of System Stability	472
VII. Time-Series-Based Prediction of Future BG Values	473
VIII. Conclusions	476
References	476
 20. Analyses for Physiological and Behavioral Rhythmicity	 479
<i>Harold B. Douse</i>	
I. Introduction	479
II. Types of Biological Data and Their Acquisition	480
III. Analysis in the Time Domain	482
IV. Analysis in the Frequency Domain	488
V. Time/Frequency Analysis and the Wavelet Transform	496
VI. Signal Conditioning	502
VII. Strength and Regularity of a Signal	505
VIII. Some Practical Considerations on Statistical Comparisons of Analytical Results	506
IX. Conclusions	507
References	508

21. Evaluation and Comparison of Computational Models	511
<i>Jay I. Myung, Yun Tang, and Mark A. Pitt</i>	
I. Update	512
II. Introduction	513
III. Conceptual Overview of Model Evaluation and Comparison	513
IV. Model Comparison Methods	516
V. Model Comparison at Work: Choosing Between Protein Folding Models	521
VI. Conclusions	525
References	526
22. Algebraic Models of Biochemical Networks	529
<i>Reinhard Laubenbacher and Abdul Salam Jarrah</i>	
I. Introduction	530
II. Computational Systems Biology	531
III. Network Inference	541
IV. Reverse-Engineering of Discrete Models: An Example	545
V. Discussion	553
References	556
23. Monte Carlo Simulation in Establishing Analytical Quality Requirements for Clinical Laboratory Tests: Meeting Clinical Needs	561
<i>James C. Boyd and David E. Bruns</i>	
I. Update	562
II. Introduction	563
III. Modeling Approach	566
IV. Methods for Simulation Study	567
V. Results	568
VI. Discussion	580
References	582
24. Pancreatic Network Control of Glucagon Secretion and Counterregulation	585
<i>Leon S. Farhy and Anthony L. McCall</i>	
I. Update	586
II. Introduction	588
III. Mechanisms of Glucagon Counterregulation (GCR) Dysregulation in Diabetes	589

IV. Interdisciplinary Approach to Investigating the Defects in the GCR	591
V. Initial Qualitative Analysis of the GCR Control Axis	592
VI. Mathematical Models of the GCR Control Mechanisms in STZ-Treated Rats	595
VII. Approximation of the Normal Endocrine Pancreas by a Minimal Control Network (MCN) and Analysis of the GCR Abnormalities in the Insulin-Deficient Pancreas	598
VIII. Advantages and Limitations of the Interdisciplinary Approach	609
IX. Conclusions	612
References	612
