CHAPTER 1 Introduction to Virus Origins and Their Role in Biological Evolution	1
1.1 Considerations on Biological Diversity	2
1.2 Some Questions of Current Virology and the Scope of This Book	3
1.3 The Staggering Ubiquity and Diversity of Viruses: Limited Morphotypes	4
1.4 Origin of Life: A Brief Historical Account and Current Views	8
1.4.1 Early Synthesis of Oligonucleotides: A Possible Ancestral Positive Selection	10
1.4.2 A Primitive RNA World	11
1.4.3 Life from Mistakes, Information from Noninformation: Origin of Replicons	13
1.4.4 Uptake of Energy and a Second Primitive Positive Selection	15
1.5 Theories of the Origins of Viruses	17
1.5.1 Viruses Are Remnants of Primeval Genetic Elements	18
1.5.2 Viruses Are the Result of Regressive Microbial Evolution	19
1.5.3 Viruses Are Liberated Autonomous Entities	20
1.5.4 Viruses Are Elements for Long-Term Coevolution	20
1.5.5 Viruses from Vesicles	21
1.6 Being Alive Versus Being Part of Life	22
1.7 Role of Viruses in the Evolution of the Biosphere	23
1.7.1 Current Exchanges of Genetic Material	24
1.7.2 Symbiotic Relationships	25
1.8 Virus and Disease	25
1.9 Overview and Concluding Remarks	26
References	27
CHAPTER 2 Molecular Basis of Genetic Variation of Viruses: Error-Prone Replication	35
2.1 Universal Need of Genetic Variation	36
2.2 Molecular Basis of Mutation	37
2.3 Types and Effects of Mutations	40
2.4 Inferences on Evolution Drawn from Mutation Types	43
2.5 Mutation Rates and Frequencies for DNA and RNA Genomes	44
2.6 Evolutionary Origins, Evolvability, and Consequences of High Mutation Rates: Fidelity Mutants	48

2.7	Hypermutagenesis and its Application to Generate Variation: APOBEC and ADAR Activities	52
2.8	Error-Prone Replication and Maintenance of Genetic Information: Instability of Laboratory Viral Constructs	53
2.9	Recombination in DNA and RNA Viruses	54
2.9.1	Molecular Occurrence Versus Observed Recombination	56
2.10	Genome Segment Reassortment	58
2.11	Transition Toward Viral Genome Segmentation: Implications for General Evolution	58
2.12	Mutation, Recombination, and Reassortment as Individual and Combined Evolutionary Forces	59
2.13	Overview and Concluding Remarks	62
	References	63
CHAPTER 3	Darwinian Principles Acting on Highly Mutable Viruses	73
3.1	Theoretical Frameworks to Approach Virus Evolution	74
3.1.1	Theory and Experiment	77
3.2	Genetic Variation, Competition, and Selection	78
3.3	Mutant Distributions During DNA and RNA Virus Infections	79
3.4	Positive Versus Negative Selection: Two Sides of the Same Coin	81
3.5	Selection and Random Drift	83
3.6	Viral Quasispecies	84
3.6.1	The Origins of Quasispecies Theory	84
3.6.2	Deterministic Versus Stochastic Quasispecies	86
3.6.3	Mutant Spectra, Master Genomes, and Consensus Sequences	89
3.6.4	Measurement of Quasispecies Complexity: Insights from New Generation Sequencing	91
3.6.5	Some Key Points on the Impact of Quasispecies in Virology	97
3.7	Sequence Space and State Transitions	99
3.7.1	Virus Evolution as a Movement in Sequence Space	99
3.7.2	Exploration of Sequence Space and the Sampling Problem: Viral Population Size as a Key Parameter	101
3.8	Modulating Effects of Mutant Spectra: Complementation and Interference: An Ensemble as the Unit of Selection	104
3.8.1	Molecular Mechanisms of Complementation and Interference	108
3.8.2	Individual Versus Group Selection	110
3.8.3	Stochastic Effects in Selected Collectivities	111
3.9	Viral Populations in Connection with Biological Complexity	113
3.10	Overview and Concluding Remarks	113
	References	114

CHAPTER 4	Interaction of Virus Populations with Their Hosts	123
4.1	Contrasting Viral and Host Population Numbers	124
4.1.1	Productive Power of Some Viral Infections	126
4.1.2	Population Size Limitations and the Effect of Bottlenecks: The Effective Population Size	127
4.2	Types of Constraints and Evolutionary <i>Trade-Offs</i> in Virus-Host Interactions	131
4.2.1	Long-term History Dictates Basal Constraints	132
4.2.2	Cell-dependent Constraints: No Free Lunch	132
4.2.3	Constraints in Host Organisms: Contrast with Man-made Antiviral Interventions	134
4.3	Codon Usage as a Selective Constraint: Virus Attenuation Through Codon and Codon-pair Deoptimization	135
4.3.1	The Synonymous Codon Space Can Affect an Evolutionary Outcome	137
4.4	Modifications of Host Cell Tropism and Host Range	138
4.4.1	Nonstructural Viral Proteins and RNA in Cell Tropism and Host Range of Viruses	142
4.5	Trait Coevolution: Mutual Influences Between Antigenic Variation and Tropism Change	144
4.6	Escape from Antibody and Cytotoxic T Cell Responses in Viral Persistence: Fitness Cost	147
4.7	Antigenic Variation in the Absence of Immune Selection	148
4.8	Constraints as a Demand on Mutation Rate Levels	149
4.9	Multifunctional Viral Proteins in Interaction with Host Factors: Joker Substitutions	151
4.10	Alternating Selective Pressures: The Case of Arboviruses	153
4.11	Overview and Concluding Remarks	154
	References	156
CHAPTER 5	Viral Fitness as a Measure of Adaptation	169
5.1	Origin of the Fitness Concept and Its Relevance to Viruses	170
5.1.1	Measurement of Viral Fitness	170
5.1.2	Power and Limitations of Fitness Measurements	172
5.1.3	Dissection of Fitness Determinants	173
5.2	The Challenge of Fitness <i>In Vivo</i>	174
5.3	Fitness Landscapes	175
5.3.1	Justification of Ruggedness in Fitness Landscapes for Viruses	177
5.4	Population Factors on Fitness Variations: Collective Fitness and Perturbations by Environmental Heterogeneity	178
5.5	Quasispecies Memory and Fitness Recovery	180
5.5.1	Implications of Quasispecies Memory: Harbinger Mutations	183

5.6	The Relationship Between Fitness and Virulence	184
5.7	Fitness Landscapes for Survival: The Advantage of the Flattest.....	187
5.8	Fitness and Function.....	189
5.9	Epidemiological Fitness.....	189
5.10	Overview and Concluding Remarks	190
	References.....	191
CHAPTER 6	Virus Population Dynamics Examined with Experimental Model Systems	197
6.1	Value of Experimental Evolution.....	198
6.2	Experimental Systems in Cell Culture and <i>In Vivo</i>	199
6.2.1	"To Culture is to Disturb"	200
6.2.2	Experimental Evolution <i>In Vivo</i>	202
6.3	Viral Dynamics in Controlled Environments: Alterations of Viral Subpopulations	203
6.4	Persistent Infections in Cell Culture: Virus-cell Coevolution.....	205
6.4.1	Back Again 4000 Million Years: Contingency in Evolution	208
6.5	Teachings from Plaque-to-Plaque Transfers.....	209
6.5.1	Muller's Ratchet and the Advantage of Sex.....	212
6.5.2	Molecular Basis of Fitness Decrease: Deep Fluctuations, Massive Extinctions, and Rare Survivors	213
6.6	Limits to Fitness Gain and Loss	215
6.7	Competitive Exclusion Principle and Red Queen Hypothesis.....	216
6.7.1	Contingent Neutrality in Virus.....	218
6.8	Studies with Reconstructed Quasispecies.....	218
6.9	Quasispecies Dynamics in Cell Culture and <i>In Vivo</i>	219
6.10	Overview and Concluding Remarks	219
	References.....	220
CHAPTER 7	Long-term Virus Evolution in Nature	227
7.1	Introduction to the Spread of Viruses. Outbreaks, Epidemics, and Pandemics.....	228
7.2	Reproductive Ratio as a Predictor of Epidemic Potential. Indeterminacies in Transmission Events	229
7.3	Rates of Virus Evolution in Nature.....	232
7.3.1	Influence of the Time of Sampling	233
7.3.2	Interhost Versus Intrahost Rate of Evolution.....	235
7.3.3	Rate Discrepancies and the Clock Hypothesis	237
7.4	Long-term Antigenic Diversification of Viruses	238
7.4.1	Widely Different Number of Serotypes Among Genetically Variable Viruses	239
7.4.2	Similar Frequencies of Monoclonal Antibody-escape Mutants in Viruses Differing in Antigenic Diversity	242

7.5	Comparing Viral Genomes. Sequence Alignments and Databases	243
7.6	Phylogenetic Relationships Among Viruses. Evolutionary Models	246
7.7	Extinction, Survival, and Emergence of Viral Pathogens. Back to the Mutant Clouds	248
7.7.1	Factors in Viral Emergence	251
7.7.2	Complexity Revisited	255
7.8	Overview and Concluding Remarks	255
	References	256
CHAPTER 8	Quasispecies Dynamics in Disease Prevention and Control	263
8.1	Medical Interventions as Selective Constraints	264
8.2	Different Manifestations of Virus Evolution in the Prevention and Treatment of Viral Disease	265
8.3	Antiviral Vaccines and the Adaptive Potential of Viruses	266
8.3.1	Some Requirements for the Design of Vaccines to Control Highly Variable Viruses	266
8.3.2	Vaccination-Induced Evolution	268
8.4	Resistance to Antiviral Inhibitors	269
8.4.1	Replicative Load and Antiviral Resistance	271
8.4.2	Barriers to Drug Resistance	275
8.4.3	Drug Efficacy, Mutant Frequencies, and Selection of Escape Mutants	277
8.4.4	Phenotypic Barrier and Selective Strength	280
8.4.5	Multiple Pathways and Evolutionary History in the Acquisition of Drug Resistance	281
8.5	Molecular Mechanisms of Antiviral Resistance	282
8.5.1	Some Examples with HIV-1	282
8.5.2	Mutation Site and Functional Barrier	283
8.5.3	Additional Considerations on Escape Mutant Frequencies	283
8.6	Antiviral Resistance Without Prior Exposure to Antiviral Agents	285
8.7	Fitness or a Fitness-Associated Trait as a Multidrug-Resistance Mechanism	285
8.8	Viral Load, Fitness, and Disease Progression	288
8.9	Limitations of Simplified Reagents and Small Molecules as Antiviral Agents	289
8.10	"Hit Early, Hit Hard"	290
8.11	Information and Global Action	291
8.12	Overview and Concluding Remarks	292
	References	293
CHAPTER 9	Trends in Antiviral Strategies	299
9.1	The Challenge	300
9.1.1	Virus as Moving Targets	302
9.2	Practiced and Proposed Strategies to Confront the Moving Target Challenge with Antiviral Inhibitors	302

9.2.1 Combination Treatments.....	302
9.2.2 Split Treatments.....	303
9.2.3 Targeting Cellular Functions.....	304
9.2.4 Use of Drugs That Stimulate the Host Innate Immune System.....	305
9.2.5 Combined Use of Immunotherapy and Chemotherapy.....	305
9.3 Lethal Mutagenesis and the Error Threshold.....	305
9.3.1 Reconciliation of Theory and Experiment: A Proposal.....	306
9.4 Virus Extinction by Mutagenic Agents.....	311
9.4.1 The Search for New Mutagenic Nucleotide Analogs.....	316
9.5 Lethal Mutagenesis <i>In Vivo</i> : Complications Derived From Multiple Mechanisms of Drug Action —The Case of Ribavirin.....	317
9.6 Virus Resistance to Mutagenic Agents: Multiple Mechanisms and Evidence of Abortive Escape Pathways.....	319
9.6.1 Unpredictable Effects of Some Polymerase Substitutions.....	321
9.6.2 Polymerase Fidelity and Modulation of Nucleotide Incorporation.....	321
9.7 Virus Extinction as the Outcome of Replacement of Virus Subpopulations: Tempo and Mode of Mutation Acquisition.....	323
9.8 The Interplay Between Inhibitors and Mutagenic Agents in Viral Populations: Sequential Versus Combination Treatments.....	324
9.9 Prospects for a Clinical Application of Lethal Mutagenesis.....	327
9.10 Some Atypical Proposals.....	328
9.11 Overview and Concluding Remarks.....	329
References.....	330
CHAPTER 10 Collective Population Effects in Nonviral Systems	339
10.1 Concept Generalization.....	339
10.2 Viruses and Cells: The Genome Size-Mutation-Time Coordinates Revisited.....	340
10.2.1 A Comparison of Antiviral and Antibiotic Resistance.....	342
10.3 Darwinian Principles and Intrapopulation Interactions Acting on Cell Populations.....	343
10.4 The Dynamics of Unicellular Parasites in the Control of Parasitic Disease.....	344
10.5 Cancer Dynamics: Heterogeneity and Group Behavior.....	345
10.5.1 The Two-Component Theory of Cancer: Similarities with Other Biological Systems.....	346
10.6 Collective Behavior of Prions.....	347
10.7 Molecular Mechanisms of Variation and Clonality in Evolution.....	349
10.8 Genomes, Clones, Consortia, Networks, and Power Laws.....	351
10.9 An Additional Level of Virus Vulnerability?.....	354
10.10 Overview and Concluding Remarks.....	356
References.....	357
Further Reading.....	363
Author Index.....	367
Subject Index.....	399
