Contents

1. Introduction	2
2. Fungal Light Sensing: of Prisms and Proteins	4
2.1 Blue Light: Making Fungi LOV and CRY	4
2.1.1 <i>The White Collar Orthologs</i>	4
2.1.2 <i>VIVID and ENVOY: Small LOV Domain Proteins with Big Roles</i>	13
2.1.3 <i>Cryptochromes: "New" Functions for an Ancient Protein</i>	15
2.2 Red Light: Phytochromes Under the Light	18
2.2.1 <i>FphA in the Nucleus</i>	19
2.2.2 <i>FphA in the Cytoplasm</i>	20
2.3 Green Light: A Story of Opsin Evolutionary and Functional Elusiveness	21
2.4 Concluding Remarks	23
3. Photobiology in Industrially Important Fungi	24
3.1 Light Regulation of Primary Metabolism: Food for Thought ... and Fuel	24
3.2 Light Regulation of Secondary Metabolism: A Tale of Toxins	27
4. Photobiology in Agriculturally Important Fungi	29
4.1 Regulation of Virulence of Plant Pathogenic Fungi by Light and/or Photosensory Pathways	30
4.1.1 <i>Light Induction of Fungal Virulence</i>	30
4.1.2 <i>Light Suppression of Virulence</i>	31
4.1.3 <i>Circadian Control over the Host-Pathogen Interaction</i>	33
4.2 Light as an Agent to Promote Sporulation and Robustness of Biocontrol Fungi	35
5. Photobiology in Medically Important Fungi	37
5.1 Do the White Collar Proteins Play a Conserved Role in Human Fungal Pathogenesis?	38
5.2 Can Light Itself Augment Fungal Virulence?	39
6. In Conclusion: Let There be Light!	40
Acknowledgments	40
