Preface	xi
1. The evolution of ideas on insect metamorphosis	1
Classical Greece	1
From classical Greece until the Renaissance	3
The 17th century	5
The enlightenment	8
Darwin's times	11
The 20th century	13
References	16
2. A spectacular diversity of forms and developmental modes	19
A long evolutionary history	19
New resources to be exploited, new ecological opportunities	21
The wings, a crucial innovation	22
The innovation of metamorphosis and their different types	25
Unity and diversity of embryonic development	28
References	31
3. The ametabolan development	35
Embryogenesis in ametabolan species	37
Postembryonic development	38
Unscaled juveniles	39
Scaled juveniles	40
Adults	42
References	44
4. The hemimetabolan development	47
Embryogenesis in hemimetabolan species	47
The hemimetaboly in Palaeoptera	49
Odonata	49
Ephemeroptera	52
The Polyneoptera	56

The Paraneoptera	59
Psylloidea, Aleyrodoidea, and Coccoomorpha	61
Thysanoptera	64
References	66
5. The holometabolan development	71
Embryogenesis in holometabolan species	72
Imaginal precursor cells, imaginal discs, and histoblasts	73
The larva	80
The pupa	83
Hypermetamorphosis	84
Hypermetamorphosis in parasitoids with a wandering first larval instar	85
Hypermetamorphosis in nonparasitoids with a wandering first larval instar. The case of <i>Micromalthus debilis</i>	91
Hypermetamorphosis in parasitoids with a sedentary first larval instar	93
Contracted life cycles	96
References	98
6. Hormones involved in the regulation of metamorphosis	105
The nature of the molting hormone	106
The prothoracic gland and the synthesis of ecdysteroids	107
The prothoracicotrophic hormone	109
Insulin-like peptides	109
Other peptides affecting ecdysone synthesis in the prothoracic gland	112
Other factors affecting the prothoracic gland activity	114
The juvenile hormones	114
The corpora allata	116
Allatotropins and allatostatins	118
Allatotropins	118
Allatostatins	119
Peptides regulating ecdysis and tanning	121
Ecdysis triggering hormone	121
Eclosion hormone	121
Corazonin	123
Crustacean cardioactive peptide	123
Bursicon	123
References	124
7. Molecular mechanisms regulating hormone production and action	131
Production of ecdysone in the prothoracic gland	132
Action of prothoracicotrophic peptides	132

Action of prothoracicostatic peptides	133
Transcription factors involved in regulating the expression of ecdysteroidogenic genes	135
Production of juvenile hormone in the corpora allata	135
Action of allatotropins	136
Action of allatostatins	136
Mechanisms of regulation of ecdysis and tanning	137
Action of corazonin	138
Action of ecdysis-triggering hormone and eclosion hormone	139
Action of crustacean cardioactive peptide	140
Action of bursicon	140
Transduction of the 20-hydroxyecdysone signal	140
The ecdysone receptor	141
Early response genes	143
Late response genes	145
The 20-hydroxyecdysone signaling pathway in insects other than <i>Drosophila melanogaster</i>	146
The role of Broad-complex as promoter of the pupal stage	147
The role of E93 as promoter of metamorphosis	147
Transduction of the juvenile hormone signal	150
Met, the juvenile hormone intracellular receptor	151
A membrane receptor for juvenile hormone	153
Krüppel homolog 1, a master transducer of the antimetamorphic action of juvenile hormone	154
E93: a key target of Krüppel homolog 1. The MEKRE93 pathway	155
Regulation of developmental gene expression and chromatin accessibility	158
Interactions between the 20-hydroxyecdysone and the juvenile hormone pathways	159
The TGF- β signaling pathway	160
Competence to metamorphose	162
References	163
8. Epigenetic-related mechanisms	177
DNA methylation	178
DNA methylation and embryogenesis	179
DNA methylation and postembryonic development	179
Histone modifications	180
Histone acetylation at lysine residues	180
Histone methylation at lysine and arginine residues	183
Noncoding RNAs	187
miRNAs and hemimetabolite metamorphosis	188
miRNAs and holometabolite metamorphosis	189
Long noncoding RNAs	192
References	193

9. Molting: the basis for growing and for changing the form	199
The insect cuticle	199
Determination of molting time: Basic mechanisms	200
The apolysis and the secretion of a new cuticle	202
The ecdysis	203
Sclerotization and hardening	205
Endocrine regulation of the molting process	206
The metamorphic molt	208
Control of developmental timing and adult body size	208
Regulation of right allometric growth	210
Histolysis of the prothoracic gland	211
Secretion of embryonic cuticles	212
References	212
10. Regulation of ametabolan, hemimetabolan, and holometabolan development	217
Hormones and embryogenesis	218
Ecdysteroids	218
Juvenile hormone	218
Regulation of postembryonic development in ametabolans	222
Regulation of postembryonic development in hemimetabolans	223
Palaeoptera	223
Polyneoptera	225
Paraneoptera	226
Regulation of postembryonic development in holometabolans	229
<i>Tribolium castaneum</i>	229
<i>Bombyx mori</i>	232
<i>Drosophila melanogaster</i>	233
Mechanisms regulating holometabolan neoteny: <i>Xenos vesparum</i>	234
References	234
11. The origin of hemimetaboly	241
The origin of wings and the emergence of hemimetaboly	241
The final molt: a crucial innovation	245
Possible mechanisms underlying the transition from ametaboly to hemimetaboly	246
The components of the MEKRE93 pathway and Broad-complex predate the origin of Pterygota	247
References	248
12. The evolution of metamorphosis	251
Selective advantages of holometaboly	251
The larva and the pupa	252

Two theories to explain the evolution of metamorphosis	254
The pronymph theory	255
The theory of direct homology between stages	256
Testing hypotheses	257
Embryonic cuticles	258
Embryo development	258
Juvenile hormone and embryogenesis	260
Broad-complex in the embryo	261
Broad-complex and postembryonic development	262
Molecular mechanisms regulating metamorphosis	264
The Broad-complex hypothesis. A mechanism to explain the origin of holometaboly	264
References	267
Epilogue	273
Index	277
