Introduction

ix

1. Pre-Ediacaran evolution

Emergence of animal multicellularity	1
Emergence of multicellularity	2
Choanoflagellates	3
Transition to multicellularity: new structure, new rules of game	4
Evolution of the control system	5
The choanocyte genome	7
Choanoflagellates as precursors of metazoan multicellularity	7
An "epigenetics first" hypothesis of emergence of multicellularity	13
Placozoans	15
Morphology	15
Reproduction	15
The genome	17
Behavior	18
The control system in placozoans	19
Evolution	21
References	22
Further reading	26

2. Phanerozoic evolution—Ediacaran biota

Ediacaran fauna—the prelude to the Cambrian explosion	27
Fossil record	28
The end of Ediacaran biota	33
Sponges (Porifera)	33
Fossil record	33
Morphology	35
Reproduction	35
Evolution	37
Development	38
The control system and behavior in sponges	39

Evolution of the neuron: the second informational revolution	41
Evolution of the synapse	42
Synaptic proteins in unicellulars	42
Synaptic proteins in nerveless metazoans	42
Evolution of the action potential and voltage-gated ionic channels	45
On the path to differentiation of the neuron	47
Fossil record and evolution of the neuron	48
Cnidaria	49
Reproduction	50
Development	50
The genome	51
Phylogeny of cnidarians	52
Fossil record	52
Evolution	53
Regeneration	54
Triggers of Cambrian explosion: hypotheses	55
External triggers	55
Ecological hypotheses	57
Internal triggers	60
References	61
 3. Epigenetic requisites of the Cambrian explosion	
Gene recruitment	72
Evolution of lens crystallin genes	72
Neural involvement in recruitment of gene regulatory networks for eye development	73
Neural involvement in recruitment of proteins for <i>Bothrops</i> snake venoms	75
Neural involvement in recruitment of sex pheromones in salamanders	78
Other cases of gene recruitment in metazoans	80
Neural induction of epigenetic marks	83
DNA methylation	83
Histone modification	89
Epigenetic control of expression patterns and function of microRNAs	94
Alternative splicing	104
Neural regulation of alternative splicing	106
A neural mechanism of accelerated production of splicing isoforms	106
Evolution of splicing	109
Immune defense: epigenetics of arms race with invading microorganisms	109
Evolution of the innate immunity in invertebrates	111
The acquired (adaptive) immunity in vertebrates	115
Neural control of the acquired immune response	117
References	122

4. Cambrian explosion: sudden burst of animal bauplaene and morphological diversification

End of the ediacaran fauna	138
The conventional ediacaran-cambrian boundary	139
On the reality of the Cambrian explosion	142
Low cambrian trace fossils	144
Evolution of bilateral symmetry	144
Evolution of body segmentation	147
Cambrian fossils	148
Transition to bilateria in extant paradigms	157
Xenacoelomorpha	157
Morphology	158
The genome	159
The nervous system	160
Phylogeny and evolution	161
Planarians	162
Fossil record	164
The genome	165
The nervous system	165
Neural control of behavior	166
Reproduction	170
Morphogenesis and organogenesis	171
Planarian regeneration and development	172
The instructive role of the nervous system in planarian regeneration	173
Neural correlates and driving forces of the Cambrian explosion	173
Selective pressure for centralization of the nervous system	176
Centralized nervous system in cambrian fossils	176
Centralization of the nervous system	178
Evolution of the genome and the complexity of bilaterians	180
Strong correlation between the centralization and growth of the nervous system and the evolution of complexity	180
Centralization of the nervous system and the exponential increase of computational power	183
Evolution of the centralization of the nervous system	185
Instructive role of the nervous system in development, transgenerational inheritance and speciation	188
A brief record of evidence on inductive role of the CNS in development, organogenesis, inheritance of acquired traits, and speciation	190
References	194
Further reading	210

5. Epilogue

Epigenetic mechanisms of evolution and the source of the epigenetic information	214
The CNS has an instructive role in development and organogenesis of extant bilaterians	215
The maintenance of the metazoan structure	219
The CNS and the Cambrian explosion	222
Conservation of gene regulatory networks and the role of the CNS	224
References	227
Further reading	234
