Preface to the second edition xi

Preface to the first edition xiii

1. Introduction	1
1.1 Introduction	1
1.2 The book in context	2
1.3 The major ingredients	3
1.4 Readership and prerequisites	4
1.5 Organization of the book	4
2. Physiological complexity and the need for models	7
2.1 Introduction	7
2.2 Complexity	7
2.3 System dynamics	9
2.4 Feedback	17
2.5 Control in physiological systems	21
2.6 Hierarchy	27
2.7 Redundancy	27
2.8 Function and behavior and their measurement	28
2.9 Challenges to understanding	29
2.10 Exercises and assignment questions	30
3. Models and the modeling process	31
3.1 Introduction	31
3.2 What is a model?	31
3.3 Why model? The purpose of modeling	33
3.4 How do we model? The modeling process	35

3.5 Model formulation	35
3.6 Model identification	37
3.7 Model validation	39
3.8 Model simulation	41
3.9 Summary	43
3.10 Exercises and assignment questions	43
4. Modeling the data	45
4.1 Introduction	45
4.2 The basis of data modeling	45
4.3 The why and when of data models	45
4.4 Approaches to data modeling	46
4.5 Modeling a single variable occurring spontaneously	47
4.6 Modeling a single variable in response to a perturbation	62
4.7 Two variables causally related	65
4.8 Input/output modeling for control	71
4.9 Input/output modeling: impulse response and deconvolution	75
4.10 Summary	83
4.11 Exercises and assignment questions	84
5. Modeling the system	85
5.1 Introduction	85
5.2 Static models	85
5.3 Linear modeling	88
5.4 Distributed modeling	100
5.5 Nonlinear modeling	120
5.6 Time-varying modeling	157
5.7 Stochastic modeling	162
5.8 Summary	168
5.9 Exercises and assignment questions	169

6. Model identification	171
6.1 Introduction	171
6.2 Data for identification	171
6.3 Errors	176
6.4 The way forward	178
6.5 Summary	179
6.6 Exercises and assignment questions	179
7. Parametric modeling—the identifiability problem	181
7.1 Introduction	181
7.2 Some examples	185
7.3 Definitions	191
7.4 Linear models: the transfer function method	192
7.5 Nonlinear models: the Taylor series expansion method	196
7.6 Qualitative experimental design	199
7.7 Summary	204
7.8 Exercises and assignment questions	204
8. Parametric models—the estimation problem	207
8.1 Introduction	207
8.2 Linear and nonlinear parameters	209
8.3 Regression: basic concepts	210
8.4 Linear regression	215
8.5 Nonlinear regression	224
8.6 Tests for model order	233
8.7 Maximum likelihood estimation	235
8.8 Bayesian estimation	239
8.9 Optimal experimental design	242
8.10 Summary	245
8.11 Exercises and assignment questions	245

9. Nonparametric models—signal estimation	247
9.1 Introduction	247
9.2 Why is deconvolution important?	247
9.3 The problem	249
9.4 Difficulty of the deconvolution problem	250
9.5 The regularization method	255
9.6 Summary	264
9.7 Exercises and assignment questions	264
10. Model validation	267
10.1 Introduction	267
10.2 Model validation and the domain of validity	267
10.3 Validation strategies	270
10.4 Good practice in good modeling	274
10.5 Summary	276
10.6 Exercises and assignment questions	276
11. Case studies	277
11.1 Case study 1: a sum of exponentials tracer disappearance model	277
11.2 Case study 2: blood flow modeling	280
11.3 Case study 3: cerebral glucose modeling	282
11.4 Case study 4: models of the ligand–receptor system	283
11.5 Case study 5: A model of insulin secretion from a stochastic cellular model to a whole-body model	287
11.6 Case study 6: a model of insulin control	310
11.7 Case study 7: a simulation model of the glucose–insulin system	321

11.8 Case study 8: the University of Virginia (UVA)/Padova type 1 simulator – <i>in silico</i> artificial pancreas, glucose sensors and new insulin trials	334
11.9 Case study 9: illustrations of Bayesian estimation	343
11.10 Postscript	354
References	355
Index	365
