Foreword xi

Preface for the second edition xv

Acknowledgments xvii

1. Introduction to virus origins and their role in biological evolution

Abbreviations 1

1.1 Considerations on biological diversity 1

1.2 Some questions of current virology and the scope of this book 2

1.3 The staggering ubiquity and diversity of viruses: limited morphotypes 4

1.4 Origin of life: a brief historical account and current views 8

1.4.1 Early synthesis of oligonucleotides: a possible ancestral positive selection 10

1.4.2 A primitive RNA world 11

1.4.3 Life from mistakes, information from noninformation: origin of replicons 13

1.4.4 Uptake of energy and a second primitive positive selection 14

1.4.5 Definitions of life 15

1.5 Theories of the origins of viruses 16

1.5.1 Viruses are remnants of primeval genetic elements 17

1.5.2 Viruses are the result of regressive microbial evolution 18

1.5.3 Viruses are liberated autonomous entities 19

1.5.4 Viruses are elements for long-term coevolution 19

1.5.5 Viruses from vesicles 20

1.6 Teachings from mycoviruses 21

1.7 Being alive versus being part of life 22

1.7.1 Role of viruses in the evolution of the biosphere 23

1.7.2 Current exchanges of genetic material 24

1.7.3 Symbiotic relationships 24

1.8 Virus and disease 25

1.9 Viral and cellular dynamics and the tree of life 26

1.10 Overview and concluding remarks 27

References 28

2. Molecular basis of genetic variation of viruses: error-prone replication

Abbreviations 35

2.1 Universal need for genetic variation 35

2.2 Molecular basis of mutation 36

2.3 Types and effects of mutations 39

2.4 Inferences on evolution drawn from mutation types 42

2.5 Mutation rates and frequencies for DNA and RNA genomes 43

2.5.1 Undesired consequences of the confusion between mutation rates and mutation frequencies 47

2.6 Evolutionary origins, evolvability, and consequences of high mutation rates: fidelity mutants 47

2.7 Hypermutagenesis and its application to generating a variation: APOBEC and ADAR activities 52

2.8 Error-prone replication and maintenance of genetic information: instability of laboratory viral constructs 52

2.9 Recombination in DNA and RNA viruses 54

2.9.1 Molecular occurrence versus observed recombination 56

2.10 Genome segment reassortment 57

2.11 Transition toward viral genome segmentation: implications for general evolution 58

2.12 Mutation, recombination, and reassortment as individual and combined evolutionary forces 59

2.12.1 Mechanistically unavoidable versus evolutionarily relevant genetic variation	61	3.9 Viral populations in connection with biological complexity	109
2.13 Overview and concluding remarks	62	3.10 Overview and concluding remarks	111
References	64	References	113
 3. Darwinian principles acting on highly mutable viruses		 4. Interaction of virus populations with their hosts	
Abbreviations	73	Abbreviations	123
3.1 Theoretical frameworks to approach virus evolution	73	4.1 Contrasting viral and host population numbers	123
3.1.1 Theory and experiment	76	4.1.1 Productive power of some viral infections	125
3.2 Genetic variation, competition, and selection	77	4.1.2 Population size limitations and the effect of bottlenecks: the effective population size	126
3.3 Mutant distributions during DNA and RNA virus infections	78	4.2 Types of constraints and evolutionary trade-offs in virus-host interactions	129
3.4 Positive versus negative selection: two sides of the same coin	79	4.2.1 Long-term history dictates basal constraints	130
3.5 Selection and random drift	81	4.2.2 Cell-dependent constraints: No free lunch	131
3.6 Viral quasispecies	83	4.2.3 Constraints in host organisms: contrast with man-made antiviral interventions	132
3.6.1 The origins of quasispecies theory	83	4.3 Codon usage as a selective constraint: virus attenuation through codon and codon-pair deoptimization	133
3.6.2 Deterministic versus stochastic quasispecies	85	4.3.1 The synonymous codon space can affect an evolutionary outcome	135
3.6.3 Mutant spectra, master genomes, and consensus sequences	87	4.4 Modifications of host cell tropism and host range	137
3.6.4 Measurement of quasispecies complexity	89	4.4.1 Nonstructural viral proteins and RNA in cell tropism and host range of viruses	141
3.6.5 Some key points on the impact of quasispecies in virology	95	4.5 Trait coevolution: mutual influences between antigenic variation and tropism change	142
3.7 Sequence space and state transitions	97	4.6 Escape from antibody and cytotoxic T cell responses in viral persistence: fitness cost	145
3.7.1 Virus evolution as a movement in sequence space	98	4.7 Antigenic variation in the absence of immune selection	147
3.7.2 Exploration of sequence space and the sampling problem: viral population size as a key parameter	99	4.8 Constraints as a demand on mutation rate levels	147
3.8 Modulating effects of mutant spectra: interference, cooperation and complementation. An ensemble as the unit of selection	102	4.9 Multifunctional viral proteins in interaction with host factors: joker substitutions	150
3.8.1 Molecular mechanisms of complementation and interference	106	4.10 Alternating selective pressures: the case of arboviruses	151
3.8.2 Individual versus group selection	108		
3.8.3 Stochastic effects in selected collectivities	109		

4.10.1 The sophistication of pathogen-vector-host interactions in plant viruses	152
4.11 Overview and concluding remarks	153
References	155
 5. Viral fitness as a measure of adaptation	
Abbreviations	167
5.1 Origin of the fitness concept and its relevance to viruses	167
5.1.1 Measurement of viral fitness	168
5.1.2 Power and limitations of fitness measurements	169
5.1.3 Dissection of fitness determinants	171
5.2 The challenge of fitness <i>in vivo</i>	172
5.3 Fitness landscapes	173
5.3.1 Justification of ruggedness in fitness landscapes for viruses	175
5.4 Population factors on fitness variations: collective fitness and perturbations by environmental heterogeneity	176
5.5 Quasispecies memory and fitness recovery	178
5.5.1 Implications of quasispecies memory: harbinger mutations	181
5.6 The relationship between fitness and virulence	182
5.7 Fitness landscapes for survival: the advantage of the flattest	186
5.8 Fitness and function	187
5.8.1 Very low fitness versus lethality	188
5.9 Epidemiological fitness	188
5.10 Overview and concluding remarks	189
References	190
 6. Virus population dynamics examined with experimental model systems	
Abbreviations	195
6.1 Value of experimental evolution	195
6.2 Experimental systems in cell culture and <i>in vivo</i>	196
6.2.1 "To culture is to disturb"	198
6.2.2 Experimental evolution <i>in vivo</i>	198
6.3 Viral dynamics in controlled environments: alterations of viral subpopulations	201
6.4 Persistent infections in cell culture: virus-cell coevolution	203
6.4.1 Back again 4000 million years: contingency in evolution	206
6.5 Teachings from plaque-to-plaque transfers	208
6.5.1 Muller's ratchet and the advantage of sex	210
6.5.2 Molecular basis of fitness decrease: deep fluctuations, massive extinctions, and rare survivors	211
6.6 Limits to fitness gain and loss	213
6.7 Competitive exclusion principle and Red Queen hypothesis	214
6.7.1 Contingent neutrality in virus	216
6.8 Studies with reconstructed quasispecies	216
6.9 Quasispecies dynamics in cell culture and <i>in vivo</i>	217
6.10 Overview and concluding remarks	217
References	218
 7. Long-term virus evolution in nature	
Abbreviations	225
7.1 Introduction to the spread of viruses. Outbreaks, epidemics, and pandemics	225
7.2 Reproductive ratio as a predictor of epidemic potential. Indeterminacies in transmission events	227
7.3 Rates of virus evolution in nature	229
7.3.1 Influence of the time of sampling	230
7.3.2 Interhost versus intrahost rate of evolution	232
7.3.3 Rate discrepancies and the clock hypothesis	235
7.4 Long-term antigenic diversification of viruses	236
7.4.1 Widely different number of serotypes among genetically variable viruses	237
7.4.2 Similar frequencies of monoclonal antibody-escape mutants in viruses differing in antigenic diversity	240
7.5 Comparing viral genomes. Sequence alignments and databases	241
7.6 Phylogenetic relationships among viruses. Evolutionary models	245
7.7 Extinction, survival, and emergence of viral pathogens. Back to the mutant clouds	247
7.7.1 Factors in viral emergence	250
7.7.2 Complexity revisited	253
7.8 Overview and concluding remarks	254
References	255

8. Quasispecies dynamics in disease prevention and control

Abbreviations 263

- 8.1 Medical interventions as selective constraints 263
- 8.2 Different manifestations of virus evolution in the prevention and treatment of viral disease 264
- 8.3 Antiviral vaccines and the adaptive potential of viruses 265
 - 8.3.1 Some requirements for the design of vaccines to control highly variable viruses 265
 - 8.3.2 Vaccination-induced evolution 268
- 8.4 Resistance to antiviral inhibitors 269
 - 8.4.1 Replicative load and antiviral resistance 270
 - 8.4.2 Barriers to drug resistance 273
 - 8.4.3 Drug efficacy, mutant frequencies, and selection of escape mutants 276
 - 8.4.4 Phenotypic barrier and selective strength 279
 - 8.4.5 Multiple pathways and evolutionary history in the acquisition of drug resistance 280
- 8.5 Molecular mechanisms of antiviral resistance 281
 - 8.5.1 Some examples with HIV-1 282
 - 8.5.2 Mutation site and functional barrier 283
 - 8.5.3 Additional considerations on escape mutant frequencies 283
- 8.6 Antiviral resistance without prior exposure to antiviral agents 284
- 8.7 Fitness or a fitness-associated trait as a multidrug-resistance mechanism 285
- 8.8 Viral load, fitness, and disease progression 288
- 8.9 Limitations of simplified reagents and small molecules as antiviral agents 289
- 8.10 "Hit early, hit hard" 290
- 8.11 Information and global action 291
- 8.12 Overview and concluding remarks 292

References 293

9. Trends in antiviral strategies

Abbreviations 301

- 9.1 The challenge 301
 - 9.1.1 Virus as moving targets 303
- 9.2 Practiced and proposed strategies to confront the moving target challenge with antiviral inhibitors 303
 - 9.2.1 Combination treatments 303

- 9.2.2 Split treatments 304

- 9.2.3 Targeting cellular functions 305

- 9.2.4 Use of drugs that stimulate the host innate immune system 306

- 9.2.5 Combined use of immunotherapy and chemotherapy 306

- 9.3 Lethal mutagenesis and the error threshold 307

- 9.3.1 Reconciliation of theory and experiment: a proposal 307

- 9.4 Virus extinction by mutagenic agents 312

- 9.4.1 The search for new mutagenic nucleotide analogs 316

- 9.5 Lethal mutagenesis *in vivo*: complications derived from multiple mechanisms of drug action—the case of ribavirin 317

- 9.5.1 Favipiravir as antiviral inhibitor and mutagen 319

- 9.6 Virus resistance to mutagenic agents: multiple mechanisms and evidence of abortive escape pathways 320

- 9.6.1 Unpredictable effects of some polymerase substitutions 321

- 9.6.2 Polymerase fidelity and modulation of nucleotide incorporation 321

- 9.7 Virus extinction as the outcome of replacement of virus subpopulations: tempo and mode of mutation acquisition 323

- 9.8 The interplay between inhibitors and mutagenic agents in viral populations: sequential versus combination treatments 325

- 9.9 Prospects for a clinical application of lethal mutagenesis 327

- 9.10 Some atypical proposals 329

- 9.11 Overview and concluding remarks 329

References 331

10. Collective population effects in nonviral systems

Abbreviations 341

- 10.1 Concept generalization 341

- 10.2 Viruses and cells: the genome size-mutation-time coordinates revisited 343

- 10.2.1 A comparison of antiviral and antibiotic resistance 344

- 10.3 Darwinian principles and intrapopulation interactions acting on bacterial cell populations 346

10.4 The dynamics of unicellular parasites in the control of parasitic disease 347	10.8 Genomes, clones, consortia, and networks 356
10.5 Cancer dynamics: heterogeneity and group behavior 348	10.8.1 Interacting networks and power laws 356
10.5.1 The two-component theory of cancer: similarities with other biological systems, and therapeutic implications 350	10.9 An additional level of virus vulnerability? 358
10.6 Collective behavior of prions 351	10.10 Overview and concluding remarks 359
10.7 Molecular mechanisms of variation and clonality in evolution 352	References 361
	Subject index 367
	Author index 379
