1. Theoretical and computational advances in protein misfolding 1

Parbati Biswas

1. Introduction 1
2. Mechanism of protein misfolding 5
3. Simulations: atomistic and coarse grained models 8
4. Atomistic simulations of early-stages monomers, small oligomers and end products of aggregation 9
5. Coarse grained models 14
6. Conclusions 24
- Acknowledgments 24
- References 24

2. Combining molecular dynamics simulations and experimental analyses in protein misfolding 33

Holger Wille, Lyudmyla Dorosh, Sara Amidian, Gerold Schmitt-Ulms, and Maria Stepanova

1. Introduction 34
2. Basic concepts of protein misfolding and aggregation 35
3. Biophysical analyses of protein misfolding 39
4. Molecular simulations of misfolding proteins 55
5. Integrative approaches in understanding misfolding and aggregation 66
6. Open questions and challenges 84
- Acknowledgments 85
- References 85

3. Mass spectrometric approaches for profiling protein folding and stability 111

Joseph C. Genereux

1. Introduction 112
2. Terminology 113
3. Quantitation in mass spectrometry 114

4. Fractionation methods for characterizing the destabilized proteome	118
5. Enzymatic methods for identifying protein stability	121
6. Exploiting chemical reactivity to characterize protein stability	125
7. Summary	134
References	134
4. The intrinsic and extrinsic factors that contribute to proteostasis decline and pathological protein misfolding	145
<i>Elise A. Kikis</i>	
1. The proteostasis network	146
2. Genetic variation underlies differences in cellular proteostasis	146
3. Errors in transcription and translation are a source of proteotoxic stress	149
4. Proteostasis and disease	151
5. The inflammatory response and proteostasis	154
6. Environmental effects on proteostasis and disease	156
7. Discussion and outlook	158
References	159
5. Functional and dysfunctional folding, association and aggregation of caseins	163
<i>John A. Carver and Carl Holt</i>	
Abbreviations	164
1. Introduction and overview	165
2. Linear functional motifs in caseins	166
3. Caseins are not hydrophobic proteins	169
4. Caseins are intrinsically disordered proteins	170
5. Caseins bind to and sequester calcium phosphate	175
6. Caseins can act as molecular chaperones	179
7. Caseins can form amyloid fibrils	187
8. Caseins can form dynamic, fuzzy complexes	195
9. Casein micelles are non-stoichiometric, fuzzy complexes	198
10. Functional and dysfunctional interactions of caseins in the casein micelle	200
11. Concluding remarks	203
Acknowledgments	203
References	203

6. Protein misfolding in endoplasmic reticulum stress with applications to renal diseases	217
Samera Nademi and Jeffrey G. Dickhout	
Abbreviations	218
1. Introduction	219
2. ER stress in renal diseases	227
3. Therapeutic options for the treatment of kidney diseases involving protein misfolding	237
References	239
7. Misfolding of vasopressin receptors: biased agonist pharmacochaperones as potential therapeutics	249
Christiane Mendre and Bernard Mouillac	
1. Biased ligands and pharmacological chaperones for G protein-coupled receptors	250
2. Misfolded arginine-vasopressin V2 receptors and congenital nephrogenic diabetes insipidus (cNDI): an avenue for pharmacological chaperone therapy	254
3. Biased agonist pharmacochaperones: promising therapeutics for treating cNDI	262
4. Insights from pharmacochaperone high-throughput screening studies and V2 structural studies	263
5. Conclusions	266
Acknowledgments	266
References	267
8. LOXL1 folding in exfoliation glaucoma	273
Audrey M. Bernstein, Robert Ritch, and J. Mario Wolosin	
1. Introduction	274
2. Macroscopic, structural and biochemical features of XFG	275
3. LOXL1 variants and XFG risk	277
4. LOXL1 autophagy and LOXL1 in XFG patient cells	279
5. LOXL1 and intrinsic disorder	280
6. The role of the IDR in LOXL1 aggregation	281
7. Summary	284
Acknowledgments	284
References	284

9. Liquid-liquid phase transitions and amyloid aggregation in proteins related to cancer and neurodegenerative diseases	289
Guilherme A.P. de Oliveira, Yraima Cordeiro, Jerson L. Silva, and Tuane C.R.G. Vieira	
1. Introduction	290
2. Phase separation terminology in biomolecular systems	292
3. Molecular determinants involved in PS/transition and regulation	298
4. The functionalities of PS/transitions in physiology and disease	304
5. Methodological approaches to detect PS	316
6. Perspectives	319
References	321
10. Cytotoxic species in amyloid-associated diseases: Oligomers or mature fibrils	333
Mohammad Khursheed Siddiqi, Sadia Malik, Nabeela Majid, Parvez Alam, and Rizwan Hasan Khan	
1. Introduction	334
2. Protein folding misfolding and aggregation	336
3. Structural features of amyloid fibrils and oligomers	340
4. Techniques used to characterize oligomer and mature fibrils	342
5. Cytotoxicity of Oligomer and mature fibril	352
6. Mechanism of cytotoxicity	355
7. Conclusion	358
Acknowledgments	359
References	359
11. Misfolded proteins as a therapeutic target in Alzheimer's disease	371
S. Imindu Liyanage and Donald F. Weaver	
1. Alzheimer's disease	372
2. Forms of Alzheimer's dementia	374
3. Amyloid- β	375
4. The amyloid hypothesis: fact or folly	385
5. Tau protein	395
6. Conclusions & future outlook	399
Acknowledgments	400
References	400

12. Influence of the reducing environment in the misfolding of wine proteins 413

Paolo Ruzza, Claudia Honisch, Matteo Marangon, Andrea Curioni, Alan Bakalinsky, and Simone Vincenzi

1. Introduction 414
2. Protein instability 422
3. A case study: effects of reducing agent on WTL1 427
4. Outlook 431
- References 432
