
Contents

1	Prologue	1
1.1	The metapopulation approach	1
1.2	Some related approaches	3
1.3	The past 50 years	8
1.4	An empiricist's guide to metapopulation models	11
1.5	A theoretician's guide to field studies	16
1.6	The structure of this book	20
	PART I THEORY	23
2	Preliminaries	27
2.1	Local population dynamics	27
2.2	Population extinction	32
2.3	Migration and colonization	37
3	Metapopulations of two local populations	43
3.1	The two-population metapopulation	43
3.2	Migration and complex dynamics	46
3.3	Source-sink metapopulations	50
4	The Levins model and its variants	55
4.1	The Levins model and other patch models	55
4.2	The rescue effect and alternative equilibria	60
4.3	Structured metapopulation models	62
4.4	Habitat destruction and metapopulation extinction	67
4.5	Minimum viable metapopulation size	71

5	Spatially explicit approaches	75
5.1	Cellular landscapes	76
5.2	A spatially realistic simple model	81
5.3	The incidence function model	84
5.4	State transition models	88
5.5	<i>n</i> -population simulation models	89
5.6	Comparison of modelling approaches	95
6	Metapopulation genetics and evolution	99
6.1	Genetics, migration and colonization	99
6.2	Genetics and extinction	104
6.3	Loss, or gain, of genetic variation?	107
6.4	The shifting balance theory	112
6.5	Extinction-colonization dynamics—summary	113
7	Interacting metapopulations and metacommunities	115
7.1	Competing species	115
7.2	Predator-prey metapopulations	121
7.3	Predation and complex spatial dynamics	126
7.4	Metacommunity dynamics	129
7.5	Species-richness of communities and distribution of species	131
PART II FIELD STUDIES		139
8	Spatial structure of populations	141
8.1	The nature of populations	141
8.2	Population turnover	144
8.3	Mechanisms of population extinction	145
8.4	Sources and sinks	149
8.5	Small-bodied habitat specialists	153
8.6	The end of the species	155
9	Mapping species occurrence on habitat availability	158
9.1	Empty habitat	158
9.2	Patch area and isolation	160
9.3	Network size	167
9.4	Distribution-abundance relationship	169
9.5	Core and satellite species	173

10 Metapopulation dynamics and conservation biology	179
10.1 Paradigm shift	179
10.2 Habitat fragmentation and metapopulation persistence	183
10.3 Metapopulation establishment	190
10.4 The northern spotted owl	195
10.5 Other case-studies	199
10.6 Spatially extended population viability analysis	203

PART III THE GLANVILLE FRITILLARY—A CASE STUDY 205

11 Metapopulation patterns and processes	207
11.1 The Glanville fritillary on Åland islands	209
11.2 Local dynamics and population extinction	214
11.3 Migration and population establishment	220
11.4 Four necessary conditions for metapopulation-level persistence	224
11.5 Patch occupancy patterns	227
11.6 Summary	231

12 The incidence function model—applications	233
12.1 Parameter estimation and model simulation	233
12.2 Predicted dynamics and steady states	240
12.3 Alternative equilibria	244
12.4 Predictions for other species	248
12.5 Non-equilibrium dynamics	254
12.6 Summary	260

13 Epilogue	261
13.1 The achievements	261
13.2 Old and new challenges	264
