Chapter 1	Introduction	1
What is a microbe?		1
Why study microbial ecology?		2
Microbes cause diseases of macroscopic organisms, including humans		2
Microbes help to make our food and other useful products		3
Microbes degrade and detoxify pollutants		5
Microbes are models for exploring principles in ecology and evolution		5
Microbes living today are models for early life on Earth and perhaps life on other planets		6
Microbes mediate biogeochemical processes that affect global climate		7
Microbes are everywhere, doing nearly everything		9
How do we study microbes in nature?		11
Separating microbes by phylogeny: the three domains of life		13
Separating microbes into functional groups		15
Autotroph versus heterotroph		15
Phototroph versus chemotroph		16
Combining structure and function		17
Summary		17
Chapter 2	Elements, biochemicals, and structures of microbes	18
Elemental composition of microbes		18
Elemental ratios in biogeochemical cycles and studies		20
C:N and C:P ratios for microbes		22
Biochemical composition of microbes		23
Variation in elemental ratios and biochemical composition		25
Architecture of a microbial cell		26
Membranes of microbes and active transport		27
Cell walls in prokaryotes and eukaryotes		28
Components of microbial cells as biomarkers		30

Extracellular structures	31
Extracellular polymers of microbes	31
Flagella and cilia; fimbriae and pili	32
Summary	34
 Chapter 3 The physical-chemical environment of microbes	35
Some important physical-chemical properties	35
Water	35
Temperature	35
pH	38
Salt and osmotic balance	40
Oxygen and redox potential	41
Light	42
Pressure	43
The consequences of being small	43
Microbial life in natural aquatic habitats	45
Motility and taxis	46
Submicron- and micron-scale patchiness in aqueous environments	47
Microbial life in soils	48
Water content of soils	48
Interactions between temperature and water content in soils	50
The biofilm environment	51
Summary	52
 Chapter 4 Community structure of microbes in natural environments	53
Taxonomy and phylogeny via genes: introduction to 16S rRNA-based methods	53
The species problem	56
Terms of diversity	57
Patterns of diversity	59
Bacterial communities are diverse but very uneven	59
Uncultivated bacteria are not the same as easily cultivated bacteria	61
Different bacteria are found in soils, freshwaters, and the oceans	62
A few bacteria are widely distributed	63
Archaea in non-extreme environments	64
Ecological processes that assemble microbial communities	65
Deterministic versus stochastic processes	65
Everything everywhere?	66
What controls diversity levels and bacterial community structure?	67
Oxygen, temperature, salinity, and pH	67
Moisture and soil microbial communities	68
Organic material and inorganic nutrients	69
Predation and viral lysis	70

Community structure of fungi	71
Relevance of community structure to understanding processes	72
Summary	72
Chapter 5 Genomes and meta-omics for microbes	73
What are genomics and environmental genomics?	73
Turning genomic sequences into genomic information	75
Lessons from cultivated microbes	76
Similar rRNA genes, dissimilar genomes	76
Core genomes and pangenomes	76
Genome size	77
Organization of eukaryotic versus prokaryotic genomes	78
Horizontal gene transfer	80
Genomes and growth strategies for bacteria	82
Specific genomic features and growth	82
Streamlined genomes	83
Oligotrophic versus copiotrophic bacterial genomes	84
Genomes from uncultivated microbes: metagenomics	85
Metagenomic approaches and linking structure with function	85
Single-cell genomics	86
Metatranscriptomics and metaproteomics	87
Transcriptional response of oligotrophic and copiotrophic bacteria	89
Metatranscriptomes of eukaryotic microbes	89
Summary	91
Chapter 6 Microbial primary production and phototrophy	92
Basics of primary production and photosynthesis	93
Light and algal pigments	93
The carbon dioxide-fixing enzyme	94
Primary production, gross production, and net production	95
Primary production by terrestrial higher plants and aquatic microbes	97
The spring bloom and controls of phytoplankton growth	98
Major groups of bloom-forming phytoplankton	100
Diatoms	100
Coccolithophorids and the biological pump	101
<i>Phaeocystis</i> and dimethylsulfide	102
Cyanobacteria and filamentous diazotrophs	103
After the bloom: competition for limiting nutrients	106
Primary production by coccoid cyanobacteria	107
Anaerobic anoxygenic photosynthesis	108
Sessile algae and microbial mats	110
Summary	112

Chapter 7	Degradation of organic matter	113
Who does most of the respiration on the planet?		114
Detritus and detrital food webs		116
DOM and the microbial loop		118
Bacterial growth efficiency and carbon use efficiency		119
Mechanism of organic matter degradation		120
Hydrolysis of high molecular weight organic compounds		120
Uptake of low molecular weight organic compounds: turnover versus reservoir size		122
Uptake or mineralization of N and P?		123
Degradation of lignin and other higher plant compounds		124
Interactions between organic compounds: protection and priming		126
Protection by adsorption or aggregation		126
Priming effects		127
Photoheterotrophy: energy from organic material and light		127
Contribution of microbes to ancient organic carbon and SOM formation		129
Degradation and microbial diversity		131
Summary		132
Chapter 8	Microbial growth, biomass production, and controls	133
Are microbes alive or dead?		133
Activity state of bacteria in water and soils		135
Activity state of individual bacterial taxa		135
Introduction to growth and biomass production		136
Growth in the laboratory: batch cultures		136
Growth in the laboratory: continuous cultures		138
Maintenance energy		139
Growth rates and biomass production in nature		139
Growth rates of phytoplankton, bacteria, and fungi		141
Growth rates of individual microbial taxa		142
Growth in the deep biosphere		144
What sets growth by heterotrophic microbes in nature?		145
Temperature effects on growth and carbon cycling		146
pH effects		148
Soil moisture		148
Limitation by organic carbon		149
Limitation by inorganic nutrients		150
Co-limitation and interactions between controlling factors		152
Cooperation between organisms		152
Summary		153
Chapter 9	Predation and protists	154
Bacterivory in aquatic habitats		155
Grazers of bacteria and fungi in soils and sediments		157
Mechanism of protist grazing		158

Factors affecting grazing	159
Prey number and predator-prey cycles	159
Size relationships of predator and prey	161
Chemical recognition and composition	162
Grazing by larger protists: ciliates and dinoflagellates	164
Ciliates as predators of bacteria, flagellates, and fungi	164
Heterotrophic dinoflagellates	165
Mixotrophic protists and endosymbiosis	166
Protist community structure and the evolution of eukaryotes	168
Exploring protist community structure	169
Biogeography of protists	171
Connecting protist communities with processes	172
Summary	173
 Chapter 10 The ecology of viruses	 174
What are viruses?	174
The number of viruses in natural environments	175
Counting viruses by the plaque assay	175
Counting viruses by microscopy	176
Virus-bacteria ratio in nature	177
Viral replication	178
Temperate viruses and lysogeny in nature	180
Host range of viruses	180
Viral production, loss, and mortality of bacteria	182
Percentage of infected cells	183
The viral reduction method	183
Contribution of viruses versus grazers to bacterial mortality	183
Viral decay and loss	185
Viruses are not grazers	185
Viral shunt and DOM production	185
Population dynamics of a virus and its host	186
Genetic exchange mediated by viruses	187
Metagenomics of viruses	189
Viral diversity	189
Core, noncore, and auxiliary metabolic genes	189
Viruses of other organisms	190
Mycoviruses: Viruses in fungi	191
Viruses infecting algae and amoebae	192
Summary	194
 Chapter 11 Processes in anoxic environments	 195
Introduction to anaerobic respiration	195
Microbes use electron acceptors in order of redox potential	197

Oxidation of organic carbon by different electron acceptors	199
Limitations by concentration and supply	199
Effect of physical state and chemical form	200
The anaerobic food chain	201
Fermentation	202
Acetogenesis, interspecies hydrogen transfer, and syntrophy	203
The sulfur cycle and sulfate reduction	204
Electron donors for sulfate reduction	205
Oxidation of reduced sulfur compounds and the rest of the sulfur cycle	206
Non-phototrophic sulfur oxidation	207
Sulfide oxidation by anoxygenic photosynthesis	208
The carbon source for sulfur oxidizers	209
Methane and methanogenesis	209
Methanotrophy	211
Aerobic methane degradation	211
Anaerobic methane oxidation	212
Anaerobic microbial eukaryotes	214
Summary	216
 Chapter 12 The nitrogen cycle	 217
Nitrogen fixation	218
Nitrogenase, the N_2 -fixing enzyme	218
Solving the oxygen problem	219
N_2 fixation in nature	220
Limitation of N_2 fixation	221
Ammonium assimilation, regeneration, and fluxes	222
Ammonia oxidation and nitrification	223
Aerobic ammonia oxidation by bacteria	225
Ammonia oxidation by archaea	225
Controls of aerobic ammonia oxidation	227
The second step in nitrification: nitrite oxidation	228
Complete nitrification by one organism	229
Dissimilatory nitrate reduction and denitrification	230
Anaerobic ammonia oxidation	232
Denitrification versus anaerobic ammonia oxidation	232
Sources and sinks of nitrous oxide	234
Production by bacteria and archaea	234
Consumption of N_2O	235
N budgets: global balance, local imbalances	235
Summary	236
 Chapter 13 Introduction to geomicrobiology	 237
Cell surface charge and metal sorption	237
Biomineralization by microbes	238

Iron minerals and microbes	239
Iron oxide minerals formed by iron-oxidizing bacteria	240
Magnetite and magnetotactic bacteria	243
Manganese nodules and manganese-oxidizing bacteria	244
Carbonate minerals	245
Phosphorus minerals	248
Weathering and mineral dissolution by microbes	249
Dissolution by acid and base production	249
Dissolution by low and high molecular weight chelators	251
Dissolution by lichens	251
The deep biosphere and the geomicrobiology of fossil fuels	252
Microbes in petroleum reservoirs	253
Microbes and oil spills: Deepwater Horizon	255
Summary	257
 Chapter 14 Symbioses and microbes	258
Ubiquity of symbiosis and the exceptions	259
Symbionts convert inedible organic material into food for their hosts	260
The rumen microbiome	260
Termite-microbe symbioses	261
Ant-tended fungal gardens	263
Symbionts provide dietary supplements: the aphid-<i>Buchnera</i> symbiosis	265
Symbiotic relationships supported by light or reduced sulfur	267
Coral reefs: massive structures built with microbial help	267
Chemosynthetic symbioses in marine invertebrates	268
Symbiotic microbes provide inorganic nutrients to plants	271
Diazotrophic bacteria-plant symbiosis	271
Fungus-plant symbioses	272
Non-nutritional roles: Bioluminescent squid and a quorum-sensing bacterium	274
Concluding remarks	277
Summary	277
 References	279
