Part I An Introduction to Epigenetics and Epigenetic Regulation	1
1 Epigenetic phenomena in fungi, plants and animals	3
Selective gene activity is the basis of cellular and tissue differentiation and of organismal development	3
The concept of one genome but multiple epigenomes	4
Epigenetic memory	5
Epigenetics and the human condition	5
Chapter summary	5
References	6
2 The basic structure of chromatin	7
Organization of DNA and histones in the nucleosome	7
Assembly of the chromatin fiber	9
Transitions of the chromatin fiber into different states of condensation	11
The different faces of chromatin	12
Euchromatin vs. heterochromatin	12
The molecular biology of heterochromatin	14
Euchromatin and heterochromatin have specific locations in the nucleus	14
Heterochromatic regions lag behind during genome replication	15
Chapter summary	15
References	15
Box 2.1: Repetitive sequences and transposable elements	13
3 The basic mechanism of gene transcription	17
The pre-initiation complex	17
Transcription initiation	18
Promoter clearance and early elongation	21
Pausing	21
Productive elongation	22
Co-transcriptional RNA processing events	24
Capping	24
Transcript splicing	25
Transcription termination and processing of the transcript's 3' end	25
Polymerase recycling and reinitiation of transcription	29
Chapter summary	29

<i>References</i>	29
Box 3.1: Mediator	20
Box 3.2: Serine 2 (S ₂) phosphorylation	23
Box 3.3: Two examples of regulatory alternative splicing	26
Sex determination in <i>Drosophila</i>	26
A role for alternatively spliced transcripts in oncogenesis	27

Part II Transcription is Regulated by Epigenetic Mechanisms **33**

4 Chromatin modification and remodeling	35
Gene transcription in the context of chromatin	35
Post-translational modifications (PTMs) of histones	36
Acetylation	36
Methylation	38
Phosphorylation	40
Ubiquitination	41
Sumoylation	42
Glycosylation	42
ADP ribosylation	42
Hydroxyisobutyrylation	43
Remodeling complexes	43
Histone variants and nucleosome turnover	45
Histone H3 variants	45
Histone H2A variants	45
Histone H2B variants	47
Histone H1 variants	47
DNA modifications	47
Chapter summary	48
<i>References</i>	50
Box 4.1: Examples of human diseases associated with histone and DNA modifications	48
Alzheimer's disease (AD)	49
Parkinson's disease (PD)	49
Huntington's disease (HD)	50
Rubinstein-Taybi syndrome (RSTS)	50
5 Epigenetic chromatin changes and the transcription cycle	57
Role of remodeling complexes	58
Phosphorylation of RNA polymerase	59
Role of histone covalent modifications	59
Histone acetylation	60
Histone methylation	60
Transcription without covalent modification	61
Role of histone variants	61
Interactions among transcription regulators	62
Epigenetic changes at enhancers	62
Bivalent promoters	63

Many genes are subjected to monoallelic expression	63
Heterogeneous gene expression among the cells of a particular tissue	63
Repression of transcription	64
Transcriptional configuration of the genome	64
Chapter summary	64
References	65
6 The role of non-coding RNAs	69
Long non-coding RNAs	69
LncRNAs and lincRNAs repress or enhance the transcription of target genes	69
Some lncRNAs transcribed from enhancers promote the association of these regulatory modules with their target genes	71
LincRNAs can affect gene activity by interacting directly with transcription co-factors	71
LincRNAs contribute to the topological organization of chromatin	71
Short non-coding RNAs	72
Micro RNAs (miRNAs)	72
Endogenous small interfering RNAs (siRNAs)	73
Piwi-interacting RNAs (piRNAs)	73
Small nuclear RNAs (snRNAs)	74
tRNA-derived non-coding RNAs	74
Antisense non-coding RNAs are a common byproduct of transcription	74
RNA editing	74
Chapter summary	75
References	77
Box 6.1: Transposable elements	75
7 Maintenance of the active and inactive states	80
PcG gene products guard against improper HOX gene expression	81
PcG activity is mediated through the action of repressive protein complexes	81
The mechanistic basis of PcG repression	83
PRC2	83
PRC1	83
PcG proteins alter the three-dimensional structure of the genome	84
Repression can occur without the intervention of PRC complexes	84
Normal levels of homeotic gene expression are maintained by the TrxG genes	84
TrxG complexes function by preventing PcG silencing	84
TrxG proteins participate in the general transcription process	85
The role of cohesin	85
Transvection	87
Paramutations: a special case of transvection in plants	88
Chapter summary	88
References	88
8 DNA methylation and gene expression	93
Established silencing by DNA methylation	94
The role of DNA methylation in single-copy gene regulation	94

The relation of DNA methylation to histone modification	95
Genomic imprinting	95
Epigenetic mechanisms of imprinting	96
Transmission of imprinted alleles	99
Random monoallelic expression	100
Chapter summary	100
References	100
Box 8.1: Rett syndrome (Rtt)	93
Box 8.2: Imprinting diseases	96
Beckwith-Wiedemann syndrome (BWS)	96
Prader-Willi (PWS) and Angelman (AS) syndromes	97
9 Regulation of domains and whole chromosomes	104
Transcriptional regulation of gene clusters	104
The β -globin genes	104
rRNA genes and the nucleolus	105
Histone genes	106
Transcriptional regulation of whole chromosomes	107
Dosage compensation in <i>Drosophila melanogaster</i>	107
Dosage compensation in <i>Caenorhabditis elegans</i>	110
Dosage compensation in mammals	111
Dosage compensation in birds	114
Gene duplication is a corollary to dosage compensation	114
Chapter summary	115
References	115
Box 9.1: Human aneuploidy	112
Different events can cause variation in the chromosomal constitution (karyotype)	112
Autosomal aneuploidy	112
Sex chromosome aneuploidy	112
Part III The Interplay Between Transcription and Nuclear Structures	123
10 Architectural organization of the genome	125
Evidence for the existence of chromosome territories	125
The arrangement of CTs within a nucleus	125
Chromatin domains	126
Promoters physically associate with distant enhancers	126
Insulators circumscribe the activity of enhancers	128
Insulators subdivide the genome into functional units	129
Topologically associating domains (TADs)	130
Loop extrusion as a basis of TAD formation	132
TADs can be visualized in <i>Drosophila</i> polytene chromosomes	132
TAD formation during early development	133
Insulator bodies and PcG bodies	133

Transcription and DNA replication can be regulated by relocating genes to different nuclear sub-compartments	134
Chapter summary	135
References	135
Box 10.1: Chromosome conformation capture techniques	127
Box 10.2: Multiplexed reporter assay	131
11 The nuclear envelope	140
Inner and outer membranes	140
The nuclear envelope through the cell cycle	140
The nuclear lamina	141
The lamina is a mesh of protein fibers consisting mostly of lamins	141
Association of the genome with the nuclear lamina	141
Transcriptional and epigenetic features of genes associated with the lamina	142
Facultative LADs	142
Nuclear pore complexes	143
Nuclear pore complexes (NPCs) are large multiprotein structures	143
Nuclear pores participate in the regulation of gene expression	144
Chapter summary	144
References	145
12 The nucleolus	147
Ribosome biogenesis	147
The nucleolus as a gene-silencing environment	149
The nucleolus is the site of many diverse molecular processes	150
Telomerase assembly	150
Regulation of p53 stability	150
Modifications and processing of non-ribosomal RNAs	150
Chapter summary	151
References	151
13 Nuclear bodies	153
The perinucleolar compartment	153
The Cajal bodies	153
Gemini of coiled bodies and histone locus bodies	154
Redundancy or collaboration? Storage or active processing?	154
Nuclear speckles	155
Paraspeckles	155
PML nuclear bodies	156
Nuclear stress bodies	157
Transcription factories	157
Dynamic association of polymerases and transcription units	157
Co-localization of genes in transcription factories may lead to their co-regulation	158

How do transcription factories originate?	158
Chapter summary	159
References	159

PART IV Inheritance of Chromatin Structure and Functional States **163**

14 Chromatin replication	165
An overview of the process of DNA replication	165
Coordination of DNA replication with histone synthesis and nucleosome assembly	167
Errors can occur during DNA replication	168
The DNA damage response	169
Chromosome replication in the context of nuclear organization	169
Chapter summary	170
References	171
15 DNA repair and genomic stability	173
Mismatch repair	173
Nucleotide excision and base excision repair pathways	174
DNA breaks	175
Single-strand break repair	175
Double-strand break repair	176
Detection of the double-strand break	176
Non-homologous end-joining repair pathway	176
The homologous recombination pathway	177
Epigenetic modifications in double-strand break repair	178
The conformation of chromatin at the site of a double-strand break	178
The three-dimensional arrangement of double-strand breaks	179
Chapter summary	179
References	180
16 Inheritance of chromatin modifications through the cell cycle	184
Transcription factors and co-factors	184
DNA methylation	184
Histone modifications	185
Re-establishment of the chromatin landscape in daughter cells	186
Nucleosome positioning following DNA replication	186
Transmission of genomic loop domains from parent to daughter cells	186
Epigenetic specification of centromeres	187
Chapter summary	188
References	188
17 Stem cells	191
Characteristics of stem cells	191
Totipotent cells	191

Pluripotent cells	191
Multipotent adult stem cells	194
The stem cell niche concept	194
Maintenance of pluripotency during stem cell proliferation	195
Epigenetic marks of stem cell self-renewal and differentiation	196
The role of non-coding RNAs	197
X chromosome inactivation in female stem cells	198
Chromatin architecture of stem cells	198
Chapter summary	199
References	199
18 Nuclear reprogramming and induced pluripotency	205
Methods for reprogramming somatic cells	205
Molecular aspects of reprogramming	206
Epigenetic changes during reprogramming	208
Histone modifications	208
DNA methylation	208
Therapeutic applications of iPSCs	208
Chapter summary	209
References	210
19 Transgenerational inheritance of epigenetic traits	213
Adult effects of embryonic exposure to particular environmental factors	213
Epigenetic transgenerational transmission	214
Physiological stress and chronic metabolic diseases	214
Endocrine disruptors	215
Neurodevelopmental, behavioral and psychiatric effects	216
Mechanisms of transgenerational inheritance	217
DNA methylation	217
Histone modifications	217
Epigenetic inheritance must overcome germline reprogramming	218
Small non-coding RNAs	220
Chapter summary	221
References	221
Box 19.1: The parameters of transgenerational epigenetic inheritance	214
Part V Epigenetics, Human Health and Development	225
20 Aging, cellular senescence and cancer: the role of genomic instability, cellular homeostasis and telomeres	227
Genomic instability	227
Mitochondrial DNA (mtDNA)	229
Changes in cellular homeostasis	229
Telomeres	230
Telomere biogenesis	231
Telomere protection	232

Control of telomerase levels and telomere length	232
The role of telomeres in aging and cancer	232
Chapter summary	233
References	234
21 Aging, cellular senescence and cancer: epigenetic alterations and nuclear remodeling	238
Changes in DNA methylation	238
Changes in histone modifications	239
Changes in histone variants	241
Chromatin remodeling	241
Changes in nuclear architecture	242
Changes in the size and shape of nuclei	242
Changes in the arrangement of the chromosomes	242
Changes in the A (active) and B (inactive) compartments	242
Changes in nucleolar size	243
Changes in the topological organization of the genome	243
The role of non-coding RNAs	243
Cellular (replicative) senescence as a native defense against cancer	244
Chapter summary	245
References	245
22 Developmental systems and their dysfunction	254
Neuronal regulation of learning and memory formation	254
Development of the nervous system	254
Learning and memory	254
Molecular events underlying memory establishment and consolidation	255
Epigenetic modifications associated with learning and memory	256
DNA methylation	256
Chromatin remodeling	257
Non-coding RNAs	257
Genome topology	257
Cognitive diseases	258
Development and dysfunction of the cardiovascular system	259
Epigenetic regulation of cardiac differentiation	259
Cardiovascular diseases	260
Epigenetics and immune system disorders	260
Systemic lupus erythematosus (SLE)	262
Rheumatoid arthritis (RA)	264
Chapter summary	265
References	266
Box 22.1: Interferons and interleukins	263
Interferons (IFNs)	263
Interleukins (ILs)	263
