Preface	vi
Acknowledgements	x
1 What is macroevolution? What is macroecology?	1
Why study macroevolution and macroecology?	3
A long history of ideas	6
Testing hypotheses in macroevolution	25
Case Study 1 Testing hypotheses about past events: uncovering the evolutionary origins of a new virus	30
2 How did evolution get started?	43
Natural selection	45
Experiments and models	48
Comparative tests	64
Case Study 2 Using homologies to infer history: what was the last universal common ancestor like?	78
3 Does evolution make everything bigger and better?	87
Evolutionary trends	88
Evolution of complexity	100
Case Study 3 Accounting for measurement bias: has biodiversity increased over time?	115
4 Why did evolution explode in the Cambrian?	125
The Cambrian explosion	126
Mutation	143
Case Study 4 Evo-Devo: regulatory genes and the development of body plan	156
5 Were dinosaurs evolutionary failures?	163
Adaptive radiation	164
Mass extinction	175
Case Study 5 Testing hypotheses with fossil evidence: did birds outcompete pterosaurs?	190

6 Was the diversification of mammals due to luck?	201
Timing and causes of the mammalian radiation	202
Molecular evolution	209
Molecular dating	215
Case Study 6 Bayesian molecular dates: timing of the placental mammal radiation	233
7 Is sex good for survival?	246
Why bother with sex?	247
Evolutionarily stable strategies	255
Case Study 7 Phylogenetic models of macroevolution: 'tippy' distribution of asexuality on the tree of life	275
8 Why are most species small?	283
The physiology and ecology of body size	285
All creatures great and small: body size and diversity	287
Explaining the diversity of small creatures	290
Case Study 8 Phylogenetic tests of diversification: body size and diversity in insects	307
9 Why are there so many kinds of beetles?	312
The spectacular radiation of the beetles	314
Testing hypotheses of diversity	322
Case Study 9 Timing of diversification: the beetle and angiosperm radiations	336
10 Why are there so many species in the tropics?	343
Explaining tropical diversity	345
Is the world full of species?	354
Testing hypotheses for tropical diversity	358
Case Study 10 Global dynamics of speciation, extinction, and geographical expansion	375
11 What is the future of biodiversity?	383
Extinctions, biodiversity loss, and the 'Anthropocene'	385
Big-picture conservation	398
Case Study 11 Modelling extinction risk: predicting conservation status of Data-Deficient species	416
Appendix	422
Index	424
