Diseases and medically relevant topics	xxiii
--	-------

Abbreviations	xxv
---------------	-----

Part 1 Basic concepts of life

Chapter 1 The basic molecular themes of life	3
---	----------

All life forms are similar at the molecular level	3
---	---

The energy cycle in life	4
--------------------------	---

The laws of thermodynamics deal with energy	4
---	---

Energy can be transformed from one state to another	5
---	---

• ATP (adenosine triphosphate) is the universal energy currency in life	5
---	---

Types of molecules found in living cells	5
---	----------

• Small molecules	6
-------------------	---

• Macromolecules are made by polymerization of smaller units	7
--	---

• Protein and nucleic acid molecules have information content	7
---	---

Proteins	8
-----------------	----------

• Catalysis of reactions by enzyme proteins is central to the existence of life	8
---	---

• What is the function of enzymes?	8
------------------------------------	---

Proteins work by molecular recognition	9
---	----------

• Life is self-assembling due to molecular recognition by proteins	9
--	---

• Many proteins are molecular machines	9
--	---

• How can one class of molecule carry out so many tasks?	9
--	---

Evolution of proteins	9
------------------------------	----------

• Development of new genes	9
----------------------------	---

DNA (deoxyribonucleic acid)	10
------------------------------------	-----------

• DNA directs its own replication	10
-----------------------------------	----

• Genetic code	10
----------------	----

Organization of the genome	12
-----------------------------------	-----------

How did life start?	12
----------------------------	-----------

• The RNA world	13
-----------------	----

Proteomics and genomics	13
--------------------------------	-----------

Summary	13
----------------	-----------

Further reading	15
------------------------	-----------

Problems	15
-----------------	-----------

Chapter 2 Cells and viruses	16
------------------------------------	-----------

Cells are the units of all living systems	16
--	-----------

• What determines the size of cells?	16
--------------------------------------	----

Classification of organisms	16
------------------------------------	-----------

• Prokaryotic cells	17
---------------------	----

• Eukaryotic cells	18
--------------------	----

• Basic types of eukaryotic cells	21
-----------------------------------	----

Viruses	23
----------------	-----------

Summary	25
----------------	-----------

Further reading	26
------------------------	-----------

Problems	26
-----------------	-----------

Chapter 3 Energy considerations in biochemistry	27
--	-----------

• Energy considerations determine whether a chemical reaction is possible in the cell	27
---	----

• Reversible and irreversible reactions and ΔG values	28
---	----

• The importance of irreversible reactions in the strategy of metabolism	29
--	----

• What is the significance of irreversible reactions in a metabolic pathway?	29
--	----

• How are ΔG values obtained?	29
---------------------------------------	----

• Standard free energy values and equilibrium constants	30
---	----

The release and utilization of free energy from food	30
---	-----------

ATP is the universal energy intermediate in all life	31
---	-----------

• What are the structural features of high-energy phosphate compounds?	31
--	----

• The structure of ATP	33
------------------------	----

• What transports the $-P$ around the cell?	33
---	----

• How does ATP drive chemical work?	34
-------------------------------------	----

• How does ATP drive other types of work?	35
---	----

• High-energy phosphoryl groups are transferred by enzymes known as kinases	35
---	----

Energy considerations in covalent and noncovalent bonds	36	• Binding of oxygen to haemoglobin	64
• Noncovalent bonds are the basis of molecular recognition and self-assembly of life forms	36	• Theoretical models to explain protein allostery	65
• Noncovalent bonds are also important in the structures of individual protein molecules and other macromolecules	37	• Mechanism of the allosteric change in haemoglobin	66
• Types of noncovalent bonds	37	• The essential role of 2,3-bisphosphoglycerate (BPG) in haemoglobin function	66
• Ionic bonds	37	• Effect of pH on oxygen binding to haemoglobin	68
• Hydrogen bonds	37	Summary	69
• van der Waals forces	38	Further reading	70
• Hydrophobic force	38	Problems	71
Appendix: Buffers and pK_a values	38		
• pK_a values and their relationship to buffers	39	Chapter 5 Methods in protein investigation	72
Summary	40	Purification of proteins	72
Further reading	41	• Column chromatography	73
Problems	41	• SDS polyacrylamide gel electrophoresis (SDS-PAGE)	74
		• Nondenaturing polyacrylamide gel electrophoresis	75
		The principles of mass spectrometry	77
		• Mass spectrometers consist of three principal components	77
		• Ionization methods for protein and peptide mass spectrometry	77
		• Types of mass analysers	78
		• Types of mass spectrometers	78
		Applications of mass spectrometry	78
		• Molecular weight determination of proteins	78
		• Identification of proteins using mass spectrometry without sequencing	79
		• Identification of proteins by limited sequencing and database searching	79
		• Analysis of post-translational modification of proteins	79
		Methods of sequencing protein	79
		• Classical methods	79
		• Sequence prediction of proteins from gene DNA sequences	79
		• Sequencing by mass spectrometry	80
		Determination of the three-dimensional structure of proteins	81
		• X-ray diffraction	81
		• Nuclear magnetic resonance spectroscopy	81
		• Homology modelling	82
		• An exercise in obtaining a 3-D structure from a protein database	82
		Proteomics	82
		Bioinformatics and databases	83
		Summary	85
		Further reading	85
		Problems	85

Part 2 Structure and function of proteins and membranes

Chapter 4 The structure of proteins	45
Structures of the 20 amino acids used in protein synthesis	45
The different levels of protein structure – primary, secondary, tertiary, and quaternary	48
• Primary structure of proteins	48
• Secondary structure of proteins	50
• Tertiary structure of proteins	52
• Quaternary structure of proteins	55
Protein homologies and evolution	55
Protein domains	56
• Domain shuffling	56
• Membrane proteins	56
• Conjugated proteins and post-translational modifications of proteins	56
Extracellular matrix proteins	57
• Structure of collagens	57
• Structure of elastin	59
• Structure of proteoglycans	59
• Fibronectin and integrins connect the extracellular matrix to the interior of the cell	60
Myoglobin and haemoglobin illustrate how protein structure is related to function	63
• Myoglobin	63
• Structure of haemoglobin	64

Chapter 6 Enzymes	87	Functions of membranes	113
Enzyme catalysis	87	• Membrane transport	113
• The nature of enzyme catalysis	88	• Passive transport or facilitated diffusion	116
• The induced-fit mechanism of enzyme catalysis	89	• Gated ion channels	116
Enzyme kinetics	90	• Mechanism of the selectivity of the potassium channel	117
• Hyperbolic kinetics of a 'classical' enzyme	90	• Nerve-impulse transmission	118
• Allosteric enzymes	92	• How does acetylcholine binding to a membrane receptor result in a nerve impulse?	119
General properties of enzymes	94	• Myelinated neurons permit more rapid nerve-impulse transmission	122
• Nomenclature of enzymes	94	• Role of the cell membrane in maintaining the shape of the cell	123
• Isozymes	94	• Cell-cell interactions – tight junctions, gap junctions, and cellular adhesive proteins	125
• Enzyme cofactors and activators	94	Summary	125
• Covalent modification of enzymes	94	Further reading	126
• Effect of pH on enzymes	95	Problems	126
• Effect of temperature on enzymes	95		
• Effect of inhibitors on enzymes	95		
• Competitive and noncompetitive inhibitors	95		
Mechanism of enzyme catalysis	96		
• Mechanism of the chymotrypsin reaction	96	Chapter 8 Muscle contraction, the cytoskeleton, and molecular motors	127
• The catalytic triad of the active site	97		
• The reactions at the catalytic site of chymotrypsin	98	Muscle contraction	127
• What is the function of the aspartate residue of the catalytic triad?	98	• A reminder of conformational changes in proteins	127
• Other serine proteases	99	Types of muscle cell and their energy supply	127
• A brief description of other types of protease	100	• Structure of skeletal striated muscle	128
Summary	101	• How does the myosin head convert the energy of ATP hydrolysis into mechanical force on the actin filament?	130
Further reading	102	Control of voluntary striated muscle	131
Problems	102	• How does Ca^{2+} trigger contraction?	131
		Smooth muscle differs in structure and control from striated muscle	132
Chapter 7 The cell membrane and membrane proteins	103	• Control of smooth muscle contractions	134
Basic lipid architecture of membranes	103	The cytoskeleton	135
• The polar lipid constituents of cell membranes	103	• An overview	135
• What are the polar groups attached to the phosphatidic acid?	105	• The cytoskeleton is in a constant dynamic state	136
• Membrane lipid nomenclature	107	The role of actin and myosin in nonmuscle cells	136
• What is the advantage of having so many different types of membrane lipid?	107	• Assembly and collapse of actin filaments	137
• The fatty acid components of membrane lipids	108	• The role of actin and myosin in cell movement	138
• What is cholesterol doing in membranes?	108	• The role of actin and myosin in intracellular transport of vesicles	138
• The self-sealing character of the lipid bilayer	109	Microtubules, cell movement, and intracellular transport	138
• Permeability characteristics of the lipid bilayer	109	Intermediate filaments	140
Membrane proteins and membrane structure	110	Summary	142
Structures of integral membrane proteins	111	Further reading	142
• Anchoring of peripheral membrane proteins to membranes	112	Problems	143
• Glycoproteins	112		

Part 3 Metabolism and nutrition

Chapter 9 General principles of nutrition 147

The requirement for energy and nutrients 147

- Protein 148
- Fats 148
- Carbohydrates 149
- Vitamins 149
- Guidelines for a healthy diet 152

Regulation of food intake 152

- Hunger appetite and satiety 152
- Integration of hunger and satiety signals by the hypothalamus 153

Summary 154

Further reading 155

Problems 155

Chapter 10 Food digestion, absorption, and distribution to the tissues 156

Chemistry of foodstuffs 156

Digestion and absorption 157

- Anatomy of the digestive tract 158
- What are the energy considerations in digestion and absorption? 158
- A major problem in digestion – why doesn't the body digest itself? 158

Digestion of proteins 158

- HCl production in the stomach 159
- Pepsin, the proteolytic enzyme of the stomach 159
- Completion of protein digestion in the small intestine 159
- Activation of the pancreatic proenzymes 160
- Absorption of amino acids into the bloodstream 160

Digestion of carbohydrates 161

- Structure of carbohydrates 161
- Digestion of starch 161
- Digestion of sucrose 162
- Digestion of lactose 162
- Absorption of monosaccharides 163

Digestion and absorption of fat 163

- Resynthesis of TAG in intestinal cells 164
- Chylomicrons 164

Digestion of other components of food 165

Storage of food components in the body 166

- How are the different food components stored in cells? 166
- Characteristics of different tissues in terms of energy metabolism 167
- Overall control of fuel distribution in the body by hormones 169
- Postprandial condition 169
- Fasting condition 169
- Prolonged fasting and starvation 170
- The emergency situation – fight or flight 170

Summary 170

Further reading 171

Problems 171

Chapter 11 Mechanisms of transport, storage, and mobilization of dietary components 173

Glucose traffic in the body 173

- Mechanism of glycogen synthesis 173
- Breakdown of glycogen to release glucose into the blood 175
- Key issues in the interconversion of glucose and glycogen 177
- The liver has glucokinase and the other tissues, hexokinase 177
- What happens to other sugars absorbed from the intestine? 179

Amino acid traffic in the body (in terms of fuel logistics) 180

Fat and cholesterol movement in the body: an overview 181

- Utilization of cholesterol in the body 181

Fat and cholesterol traffic in the body: lipoproteins 182

- Apolipoproteins 182
- Lipoproteins involved in fat and cholesterol movement in the body 183
- Metabolism of chylomicrons 183
- Metabolism of VLDL: TAG and cholesterol transport from the liver 183
- Release of FFA from adipose cells 188
- How are FFA carried in the blood? 188

Summary 189

Further reading 189

Problems 190

Chapter 12 Principles of energy release from food 191

Overview of glucose metabolism 191

- Biological oxidation and hydrogen-transfer systems 191

Energy release from glucose 193

- The main stages of glucose oxidation 193
- Stage 1 in the release of energy from glucose: glycolysis 193

• Stage 2 of glucose oxidation: the TCA cycle	194	• Transport of ADP into mitochondria and ATP out	225
• Stage 3 of glucose oxidation: electron transport to oxygen	196	• Reoxidation of cytosolic NADH from glycolysis by electron shuttle systems	225
• The electron transport chain – a hierarchy of electron carriers	196	• The balance sheet of ATP production by electron transport	226
Energy release from oxidation of fat	197	• Yield of ATP from the oxidation of a molecule of glucose to CO ₂ and H ₂ O	227
Energy release from oxidation of amino acids	199	• Is ATP production the only use that is made of the potential energy in the proton-motive force?	227
The interconvertibility of fuels	199	Summary	228
Summary	200	Further reading	229
Problems	201	Problems	229
Chapter 13 Glycolysis, the TCA cycle, and the electron transport system	202	Chapter 14 Energy release from fat	230
Stage 1 – glycolysis	202	Mechanism of acetyl-CoA formation from fatty acids	230
• Glucose or glycogen?	202	• 'Activation' of fatty acids by formation of fatty acyl-CoA derivatives	230
• ATP is needed at the beginning of glycolysis	202	• Transport of fatty acyl-CoA derivatives into mitochondria	231
• Interconversion of dihydroxyacetone phosphate and glyceraldehyde-3-phosphate	205	• Conversion of fatty acyl-CoA into acetyl-CoA molecules inside the mitochondrion by β -oxidation	232
• Glyceraldehyde-3-phosphate dehydrogenase – an oxidation linked to ATP synthesis	205	• Energy yield from fatty acid oxidation	232
• The final steps in glycolysis	206	Oxidation of unsaturated fat	233
• Anaerobic glycolysis	207	Oxidation of odd-numbered carbon-chain fatty acids	233
• The ATP balance sheet from glycolysis	207	Ketogenesis in starvation and type 1 diabetes mellitus	234
• Transport of pyruvate into the mitochondria	207	• How is acetoacetate made from acetyl-CoA?	234
Conversion of pyruvate to acetyl-CoA – a preliminary step before the TCA cycle	207	• Peroxisomal oxidation of fatty acids	235
• Components involved in the pyruvate dehydrogenase reaction	209	• Where to now?	235
Stage 2 – the TCA cycle	209	Summary	235
• A simplified version of the TCA cycle	210	Further reading	236
• Mechanisms of the TCA cycle reactions	210	Problems	236
• Generation of GTP coupled to splitting of succinyl-CoA	212		
• What determines the direction of the TCA cycle?	213	Chapter 15 An alternative pathway of glucose oxidation. The pentose phosphate pathway	237
• Stoichiometry of the cycle	214	The pentose phosphate pathway has two main parts	237
• How is the concentration of TCA cycle intermediates maintained?	214	• The oxidative part produces equal amounts of ribose-5-phosphate and NADPH	238
Stage 3 – the electron transport chain that conveys electrons from NADH and FADH₂ to oxygen	215	• Conversion of surplus ribose-5-phosphate into glucose-6-phosphate	238
• The electron transport chain	215	• Conversion of glucose-6-phosphate into ribose-5-phosphate without NADPH generation	240
• Oxidative phosphorylation – the generation of ATP coupled to electron transport	217	• Generation of NADPH without net production of ribose-5-phosphate	240
• How are protons ejected?	219	• Why is the pentose phosphate pathway so important in the erythrocyte?	240
• ATP synthesis by ATP synthase is driven by the proton gradient	220	Summary	241
• Structure of ATP synthase	221	Further reading	242
• The F ₁ unit and its role in the conversion of ADP + P _i to ATP	221	Problems	242
• Structure of the F ₀ unit and its role	222		
• Mechanism by which proton flow causes rotation of F ₀	223		

Chapter 16 Synthesis of glucose (gluconeogenesis)	243	What happens to the amino group after deamination? The urea cycle	269
• Mechanism of glucose synthesis from pyruvate	243	• Mechanism of arginine synthesis	270
• What are the sources of pyruvate or oxaloacetate used by the liver for gluconeogenesis?	244	• Conversion of citrulline to arginine	270
• Synthesis of glucose from glycerol	246	• Transport of the amino nitrogen from extrahepatic tissues to the liver	271
• Synthesis of glucose from propionate	247	• Diseases due to urea cycle deficiencies	272
• Effects of ethanol metabolism on gluconeogenesis	247	• Alternatives to urea formation exist in different animals	272
• Synthesis of glucose via the glyoxylate cycle in bacteria and plants	248	• Fate of the oxo-acid or carbon skeletons of deaminated amino acids	273
Summary	249	• Genetic errors in amino acid metabolism cause diseases	273
Further reading	250	• Methionine and transfer of methyl groups	274
Problems	250	Synthesis of amino acids	275
Chapter 17 Synthesis of fat and related compounds	251	• Synthesis of glutamate	275
Mechanism of fat synthesis	251	• Synthesis of aspartic acid and alanine	275
• General principles of the process	251	• Synthesis of serine	275
• Synthesis of malonyl-CoA is the first step	251	• Synthesis of glycine	275
• The acyl carrier protein (ACP) and the β -ketoacyl synthase	252	Haem and its synthesis from glycine	275
• Mechanism of fatty acyl-CoA synthesis	252	• Destruction of haem	276
• Organization of the process of fatty acid synthesis	252	• Synthesis of adrenaline and noradrenaline	277
• The reductive steps in fatty acid synthesis	254	Summary	279
• Fatty acid synthesis takes place in the cytosol	254	Further reading	280
Synthesis of unsaturated fatty acids	256	Problems	280
Synthesis of TAG and membrane lipids from fatty acids	256	Chapter 19 Nitrogen metabolism: nucleotide metabolism	281
Synthesis of new membrane lipid bilayer	257	Structure and nomenclature of nucleotides	281
• Synthesis of glycerophospholipids	257	• The sugar component of nucleotides	281
• Synthesis of new membrane lipid bilayer	259	• The base component of nucleotides	282
Synthesis of prostaglandins and related compounds	259	• Attachment of the bases in nucleotides	282
• The prostaglandins and thromboxanes	261	Synthesis of purine and pyrimidine nucleotides	283
• Leukotrienes	262	• Purine nucleotides	283
• Synthesis of cholesterol	262	• The purine salvage pathway	287
• Conversion of cholesterol into steroid hormones	262	• Formation of uric acid from purines	287
Summary	263	• Control of purine nucleotide synthesis	288
Further reading	263	• Synthesis of pyrimidine nucleotides	288
Problems	263	• How are deoxyribonucleotides formed?	289
Chapter 18 Nitrogen metabolism: amino acid metabolism	265	Medical effects of folate deficiencies	290
Nitrogen balance of the body	266	• Thymidylate synthesis is targeted by anticancer agents such as methotrexate	290
General metabolism of amino acids	266	Summary	292
• Aspects of amino acid metabolism	266	Further reading	293
• Glutamate dehydrogenase has a central role in the deamination of amino acids	267	Problems	293

Chapter 20 Mechanisms of metabolic control and their applications to metabolic integration 294

Why are controls necessary? 294

- The potential danger of futile cycles in metabolism 294

How are enzyme activities controlled? 295

- Metabolic control by varying the amounts of enzymes is relatively slow 295
- Metabolic control by regulation of the activities of enzymes in the cell can be very rapid 296
- Which enzymes in metabolic pathways are regulated? 296
- The nature of control enzymes 296

Allosteric control of enzymes 296

- The mechanism of allosteric control of enzymes and its reversibility 297
- Allosteric control is a tremendously powerful metabolic concept 297

Control of enzyme activity by phosphorylation 297

- Protein kinases and phosphatases are key players in control mechanisms 297
- Control by phosphorylation usually depends on chemical signals from other cells 298

General aspects of the hormonal control of metabolism 298

- How do glucagon, adrenaline, and insulin work? 298
- What is a second messenger? 299
- The intracellular second messenger for glucagon and adrenaline is cyclic AMP 299

Control of carbohydrate metabolism 300

- Control of glucose uptake into cells 300

Control of glycogen metabolism 301

- Control of glycogen breakdown in muscle 302
- Mechanism of muscle phosphorylase activation by cAMP 303
- Control of glycogen breakdown in the liver 304
- Reversal of phosphorylase activation in muscle and liver 304
- The switchover from glycogen degradation to glycogen synthesis 304
- Mechanism of insulin activation of glycogen synthase 304
- Control of glycolysis and gluconeogenesis 305
- Muscle and liver PFK2 enzymes are different 307
- Fructose metabolism and its control differs from that of glucose 308
- Control of pyruvate dehydrogenase, the TCA cycle, and oxidative phosphorylation 309

Controls of fatty acid oxidation and synthesis 310

- Nonhormonal controls 310
- Degradation of acetyl-CoA carboxylase is another type of control of fat metabolism 310
- Hormonal controls on fat metabolism 310

Responses to metabolic stress 311

- Response to low ATP concentrations by AMP-activated protein kinase 311
- Response of cells to oxygen deprivation 312
- Mechanism of the response to hypoxia 312

Integration of metabolism: the fed and fasting state, and diabetes mellitus 313

- Metabolism in the fed state 313
- Metabolism in the fasting state 314
- Metabolism in prolonged starvation 315
- Metabolism in type 1 diabetes mellitus 316

Summary 318

Further reading 320

Problems 321

Chapter 21 Raising electrons of water back up the energy scale – photosynthesis 322

- Overview 322
- Site of photosynthesis – the chloroplast 322

The light-dependent reactions of photosynthesis 323

- The photosynthetic apparatus and its organization in the thylakoid membrane 323
- How is light energy captured? 324
- Mechanism of light-dependent reduction of NADP⁺ 325
- Photosystem II 325
- Photosystem I 326
- How is ATP generated? 326

The 'dark reactions' of photosynthesis – the Calvin cycle 327

- How is CO₂ converted into carbohydrate? 327
- Rubisco has an apparent efficiency problem 328
- The C₄ pathway 329

Summary 330

Further reading 331

Problems 331

Part 4 Information storage and utilization

Chapter 22 The genome 335

- A brief overview 335

The structures of DNA and RNA 335

- DNA is chemically a very simple molecule 335
- DNA and RNA are both nucleic acids 336

The primary structure of DNA	336	The basic enzymic reaction catalysed by DNA polymerases	356
• There are four different nucleotide bases in DNA	336	How does a new strand get started?	357
• Attachment of the bases to deoxyribose	336	The polarity problem in DNA replication	357
• The physical properties of the polynucleotide components	337	Mechanism of Okazaki fragment synthesis	358
• Structure of the polynucleotide of DNA	337	• Enzyme complex at the replication fork in <i>E. coli</i>	358
• Deoxyribose makes DNA more stable than RNA	338	• Processing the Okazaki fragments	360
• Thymine instead of uracil allows DNA repair	338	The machinery in the eukaryotic replication fork	361
The DNA double helix	338	Telomeres solve the problem of replicating the ends of eukaryotic chromosomes	361
• Complementary base pairing	339	• How is telomeric DNA synthesized?	362
• DNA chains are antiparallel; what does this mean?	342	• Telomeres stabilize the ends of linear chromosomes	363
• Base pairing in RNA	343	• Telomere shortening correlates with ageing	363
Genome organization	343	How is fidelity achieved in DNA replication?	363
• The prokaryotic genome	343	• Exonucleolytic proofreading	364
• Plasmids	343	• Methyl-directed mismatch repair	364
• The eukaryotic genome: chromosomes	343	Repair of DNA damage in <i>E. coli</i>	365
• The mitochondrial genome	344	DNA damage repair in eukaryotes	367
The structure of protein-coding genes	344	Homologous recombination	367
• What is a gene?	344	• Mechanism of homologous recombination	369
• Protein-coding regions of genes in eukaryotes are split up into different sections	344	• Recombination in eukaryotes	369
• Gene duplication facilitates evolution of new genes	345	Replication of mitochondrial DNA	370
Most of the human genome does not encode proteins	345	DNA synthesis by reverse transcription in retroviruses	371
• Mobile genetic elements: transposons and retroviruses	346	Summary	372
• Repetitive DNA sequences	346	Further reading	373
• RNA-coding genes	347	Problems	373
• Pseudogenes	347		
Genome packaging	347		
• The prokaryotic genome is compacted in the cell	347	Chapter 24 Gene transcription	375
• How is eukaryotic DNA packed into a nucleus?	347	Messenger RNA	375
• The tightness of DNA packaging changes during the cell cycle	348	• The structure of RNA	375
• The tightness of DNA packing can regulate gene activity	349	• How is mRNA synthesized?	375
Summary	349	• Some general properties of mRNA	376
Further reading	350	• Some essential terminology	377
Problems	350	Gene transcription in <i>E. coli</i>	377
		• Phases of gene transcription	377
		• The rate of gene transcription initiation in prokaryotes	379
		• Control of transcription by different sigma factors	379
Chapter 23 DNA synthesis, repair, and recombination	352	Gene transcription in eukaryotic cells	379
Overall principle of DNA replication	352	• Eukaryotic RNA polymerases	379
Control of initiation of DNA replication in <i>E. coli</i>	353	• How is transcription initiated at eukaryotic promoters?	380
Initiation and regulation of DNA replication in eukaryotes	353	• Type II eukaryotic gene promoters	380
Unwinding the DNA double helix and supercoiling	353	• Elongation of the transcript requires Pol II modification	381
• How are positive supercoils removed ahead of the replication fork?	354	• Capping the RNA transcribed by RNA polymerase II	381
		• Split genes and RNA splicing	382

Ribozymes and self-splicing of RNA	383	• Introduction	405
• Termination of transcription in eukaryotic cells: 3' polyadenylation	384	• The structure of proteasomes	406
• Editing of mRNAs	384	• Proteins destined for destruction in proteasomes are marked by ubiquitination	406
Transcription of nonprotein-coding genes	385	• The role of proteasomes in the immune system	407
Gene transcription in mitochondria	385	Summary	407
Summary	385	Further reading	408
Further reading	386	Problems	409
Problems	386		
Chapter 25 Protein synthesis and controlled protein breakdown	387	Chapter 26 Control of gene expression	410
Essential basis of the process of protein synthesis	387	• Levels of regulation	410
• The genetic code	388	• Gene control in <i>E. coli</i> : the <i>lac</i> operon	410
A preliminary simplified look at the chemistry of peptide synthesis	388	• Structure of the <i>E. coli lac</i> operon	411
• ATP and GTP hydrolysis in translation	389	Transcriptional regulation in eukaryotes	412
• How are the codons translated?	390	• A general overview of the differences in the initiation and control of gene transcription in prokaryotes and eukaryotes	412
• Transfer RNA	390	• DNA elements involved in eukaryotic gene control	413
• The wobble mechanism	390	DNA binding by transcription factors	414
• How are amino acids attached to tRNA molecules?	392	• Most transcription factors themselves are regulated	418
Ribosomes	393	• Transcription repressors	418
Initiation of translation	394	DNA methylation and epigenetic control	421
• Initiation of translation in <i>E. coli</i>	394	Gene control after transcription is initiated: an overview	422
• Initiation factors in <i>E. coli</i>	396	Gene control post-transcription initiation in prokaryotes	422
Once initiation is achieved, elongation is the next step	396	• Attenuation in the <i>E. coli trp</i> operon	422
• Elongation factors in <i>E. coli</i>	396	• Bacterial riboswitches	423
• Mechanism of elongation in <i>E. coli</i>	396	mRNA stability and the control of gene expression	424
• How is accuracy of translation achieved?	398	• Determinants of eukaryotic mRNA stability and their role in gene expression control	424
Mechanism of translocation on the <i>E. coli</i> ribosome	398	Translational control mechanisms in eukaryotes	425
Termination of protein synthesis in <i>E. coli</i>	399	• Translational control in iron homeostasis and haem synthesis	426
Physical structure of the ribosome	399	• Regulation of globin synthesis	426
• What is a polysome?	400	Small RNAs and RNA interference	427
Protein synthesis in eukaryotes	400	• Classes and production of small RNAs in eukaryotes	427
• Incorporation of selenocysteine into proteins	402	• Molecular mechanism of gene silencing by RNAi	427
Protein synthesis in mitochondria	402	• In vivo functions and importance of noncoding RNA	428
Folding up of the polypeptide chain	402	• The potential medical and practical importance of RNAi	430
• Chaperones (heat shock proteins)	403	Summary	430
Mechanism of action of molecular chaperones	403	Further reading	431
• Enzymes involved in protein folding	404	Problems	431
Protein folding and prion diseases	405		
Programmed destruction of protein by proteasomes	405		

Chapter 27 Protein sorting and delivery	433
A preliminary overview of the field	433
• Structure and function of the ER and Golgi apparatus	434
The importance of the GTP/GDP switch mechanism in protein targeting	435
Translocation of proteins through the ER membrane	436
• Synthesis of integral membrane proteins	437
• Folding of the polypeptides inside the ER	438
• Glycosylation of proteins in the ER lumen and Golgi apparatus	439
• Proteins for lysosomes	439
• Proteins to be returned to the ER	439
• Proteins to be secreted from the cell	439
Proteins are sorted, packaged, and despatched from the ER and Golgi by vesicular transport	440
• Mechanism of COP-coated vesicle formation	440
• How does a vesicle find its target membrane?	440
• Clathrin-coated vesicles transport enzymes from the Golgi to form lysosomes	441
Posttranslational transport of proteins into organelles	441
• Transport of proteins into mitochondria	441
• Mitochondrial matrix proteins are synthesized as preproteins	441
• Delivery of proteins to mitochondrial membranes and intermembrane space	443
Nuclear–cytosolic traffic	444
• Why is there a nuclear membrane?	444
The nuclear pore complex	444
Nuclear localization signals	446
• GTP/GDP exchange imparts directionality to nuclear–cytosolic transport	446
• Regulation of nuclear transport by cell signals and its role in gene control	447
Summary	448
Further reading	449
Problems	449

Chapter 28 Manipulating DNA and genes	450
Basic methodologies	450
• Some preliminary considerations	450
• Cutting DNA with restriction endonucleases	451
• Separating DNA pieces	451
• Visualizing the separated pieces	452
• Detection of specific DNA fragments by nucleic acid hybridization probes	452

• Southern blotting	453
• Chemical synthesis of DNA	454
Sequencing DNA	454
• The principle of DNA sequencing by the chain-termination method	454
Amplification of DNA by the polymerase chain reaction	456
• Analysis of multiple gene expression in cells using DNA microarrays	457
Joining DNA to form recombinant molecules	458
Cloning DNA	459
• Cloning in plasmids	459
• Cloning libraries	461
• Cloning vectors for larger pieces of DNA	462
Applications of recombinant DNA technology	462
• Working with RNA and cDNA	462
• Production of human proteins and proteins from other sources	463
• Expressing the cDNA in <i>E. coli</i>	463
• Site-directed mutagenesis	464
• PCR in forensic science	464
• Locating disease-producing genes	466
• Knockout mice	467
• The embryonic stem (ES) cell system	467
• Gene targeting	468
• Stem cells and potential therapy for human diseases	470
• Gene therapy	470
• Transgenic organisms	471
DNA databases and genomics	471
Summary	472
Further reading	472
Problems	473

Part 5 Cells and tissues

Chapter 29 Cell signalling	477
Overview	477
• Organization of this chapter	479
What are the signalling molecules?	479
• Neurotransmitters	479
• Hormones	479
• Cytokines and growth factors	480

• Vitamin D and retinoic acid	481	• Cell cycle checkpoints	508
Responses mediated by intracellular receptors	481	• Cell cycle controls depend on the synthesis and destruction of cyclins	508
Responses mediated by receptors in the cell membrane	482	Controls in G₁ are complex	509
• There are three main types of membrane-bound receptors	482	• The G ₁ checkpoint	510
General concepts in cell signalling mechanisms	485	• How is DNA damage detected?	510
• Protein phosphorylation	485	Progression to S phase	510
• Binding domains of signal transduction proteins	485	Progression to M phase	510
• Terminating signals	486	M phase	510
Examples of signal transduction pathways	486	Cell division	511
Signal transduction pathways from tyrosine kinase receptors	486	• Mitosis	511
• The Ras pathway	486	• Meiosis	511
• Signal sorting	490	Apoptosis	513
• The phosphatidylinositol 3-kinase (PI 3-kinase) pathway and insulin signalling	491	• What is the function of apoptosis?	513
• The JAK/STAT pathways: another type of tyrosine kinase-associated signalling system	494	There are two main pathways that initiate apoptosis	514
G-protein-coupled receptors and associated signal transduction pathways	495	• Caspase enzymes are the effectors of apoptosis	514
• Overview	495	• Mechanism of an intrinsic pathway of apoptosis	515
• cAMP as second messenger: adrenaline signalling – a G-protein pathway	496	• Regulation of the intrinsic pathway of apoptosis by Bcl-2 proteins	515
• The phosphatidylinositol cascade: another example of a G-protein-coupled receptor that works via a different second messenger	499	• Mechanism of the extrinsic pathway of apoptosis	516
• Other roles of calcium in regulation of cellular processes	500	Summary	516
• Vision: a process dependent on a G-protein-coupled receptor	501	Further reading	517
Signal transduction pathway using cGMP as a second messenger	503	Problems	517
• Membrane receptor-mediated pathways	503		
• Nitric oxide signalling – activation of a soluble cytoplasmic guanylate cyclase	503	Chapter 31 Cancer	518
Summary	505	General concepts	518
Further reading	506	Cancer development involves a progression of mutations	519
Problems	506	• Development of colorectal cancer	519
		Mutations cause cancer	519
Chapter 30 The cell cycle, cell division and cell death	507	The types of genetic change involved in cancer	520
The eukaryotic cell cycle	507	Oncogenes	521
• The cell cycle is divided into separate phases	507	• How are oncogenes acquired?	521
• The cell cycle phases are tightly controlled	507	• Retroviruses can activate or acquire cellular protooncogenes	522
Cell cycle controls	508	Tumour-suppressor genes	522
• Cyclins and growth factor control in the cell cycle	508	• Mechanism of protection by the p53 gene	523
		• Mechanism of protection by the retinoblastoma gene	523
		Molecular biology advances have potential for development of new cancer therapies	523
		Summary	524
		Further reading	524
		Problems	524

Part 6 Protective mechanisms against disease

Chapter 32 Special topics: blood clotting, xenobiotic metabolism, reactive oxygen species 527

Blood clotting (thrombus formation) 527

- What signals the necessity for clot formation? 528
- How does thrombin cause thrombus formation? 528
- Keeping clotting in check 528
- Rat poison, blood clotting, and vitamin K 529

Protection against ingested foreign chemicals (xenobiotics) 530

- Cytochrome P450 530
- Secondary modification – addition of a polar group to products of the P450 attack 531
- Medical significance of P450s 531
- Multidrug resistance 532

Protection against reactive oxygen species 532

- Formation of the superoxide anion and other reactive oxygen species 532
- Mopping up oxygen free radicals with vitamins C and E 533
- Enzymic destruction of superoxide by superoxide dismutase 534

The glutathione peroxidase-glutathione reductase system 534

Summary 534

Further reading 535

Problems 535

Chapter 33 The immune system 536

Overview 536

- The innate immune system 536
- The adaptive immune response 536

- The problem of autoimmune reactions 537
- The cells involved in the immune system 537
- What does the adaptive immune response achieve? 537
- Where is the immune system located? 537

Antibody-based or humoral immunity 538

- Structure of antibodies (immunoglobulins) 538
- What are the functions of antibodies? 539
- There are different classes of antibodies 539
- Generation of antibody diversity 539

Activation of B cells to produce antibodies 540

- Deletion of potentially self-reacting B cells in the bone marrow 541
- The theory of clonal selection 541
- B cells must be activated before they can develop into antibody-secreting cells 542
- Affinity maturation of antibodies 543
- Memory cells 544

Cell-mediated immunity (cytotoxic T cells) 544

- Mechanism of action of cytotoxic T cells 545
- The role of the major histocompatibility complexes (MHCs) in the displaying of peptides on the cell surface 545
- CD proteins reinforce the selectivity of T cell receptors for the two classes of MHCs 546

Why does the human immune system reject transplanted human cells? 546

Monoclonal antibodies 546

- Humanized monoclonal antibodies 547

Summary 548

Further reading 549

Problems 549

Answers to problems 550

Index of diseases and medically relevant topics 577
