1 Cell culture 1

Samantha Touhey and Mary Heenan

- 1 Introduction 1
- 2 Safety 1
- 3 Good laboratory technique 2
- 4 Types of cell cultures 3
 - Primary cell cultures 3
 - Finite life-span cell cultures 6
 - Continuous cell lines 6
- 5 Media requirements 7
- 6 Serum-free medium 7
- 7 Subculturing cells 10
 - Subculturing adherent cells 10
 - Subculture of suspension cell systems 11
 - Subculturing cells in serum-free medium 12
- 8 Cryopreservation of cells 14
 - Cryopreservation of adherent cells 14
 - Cryopreservation of cells in serum-free medium 16
- 9 Monitoring of sterility of cell culture solutions 17
- 10 Mycoplasma analysis of cell lines 17
 - Collection of samples for mycoplasma testing 18
 - Indirect staining procedure for mycoplasma analysis 18
 - Direct microbial culture for mycoplasma analysis 20
- 11 Cloning animal cells 22
 - Isolation of clonal populations using cloning rings 22
 - Cloning procedure with the limiting dilution assay 24
 - Semi-solid media cloning 24
- 12 The application of cell culture to *in vitro* toxicity testing 25
 - Miniaturized *in vitro* methods for toxicity testing 26
 - MTT assay 28
 - Acid phosphatase assay 29
 - Neutral red assay 29
 - Protein staining assays 30
 - Growth stimulation 31

CONTENTS

2 Basic light microscopy 35

Timo Zimmermann, Rainer Pepperkok, David Stephens, Andreas Girod, and Jens Rietdorf

- 1 Introduction 35
- 2 The sample 35
 - Volume and length measurements and principal problems of sample preparation 36
 - Sample preparation 37
- 3 The light microscope 44
 - Objectives 45
 - Magnification 46
 - Illumination 47
 - Contrast methods for transmission imaging 47
 - Fluorescence microscopy 50
- 4 3D microscopy 54
 - 3D sectioning microscopes 54
 - Confocal microscopes 54
- 5 In vivo microscopy 56
- 6 Image acquisition 56
 - CCD cameras 57
 - Intensified CCD cameras 58
 - Colour cameras 58
- 7 Data analysis, image processing, and data presentation 58
- 8 Online resources 59
- References 59
- Appendix Preparation of stock solutions 61

3 Electron microscopy in cell biology 63

John Lucocq

- 1 Introduction 63
- 2 Overview of sectioning methods for transmission EM 64
 - Methods using aldehyde fixation 65
 - Methods using rapid/high pressure freezing 65
- 3 Aldehyde fixation and preliminary specimen preparation 66
 - Perfusion fixation of tissue 69
 - Embedding protocols 69
- 4 Conventional epoxy resin embedding 69
 - Contrasting epoxy resin sections 74
- 5 Thawed ultrathin cryosections 75
 - Principle 75
 - Preparing the blocks of pellet, tissue, or gelatin embedded material 75
 - Gelatin embedding 76
 - Mounting the specimen block on the specimen holder 78
 - Sectioning 78
 - Picking up the sections 78

6	Progressive lowering of temperature	79
	Sectioning hydrophilic resins	82
	Contrasting of Lowicryl sections	82
7	Freeze substitution of aldehyde fixed specimens	84
8	Cryofixed specimens	85
	High pressure freezing	85
	Rapid freezing	86
9	Freeze substitution	87
	Contrasting	88
10	Frozen hydrated sections	88
11	Immunogold labelling	89
	Preparation of reagents	89
	Immunolabelling	91
	Double labelling	94
	Adsorption of particulate/membrane organelle fractions to grids	96
	Pre-embedding labelling	98
12	Quantitation of gold labelling on ultrathin sections	99
	Labelling proportions	100
	Density of gold labelling over an organelle (profile)	101
	Controls for the specificity of labelling	104
13	Methods for visualizing molecules and macromolecular assemblies	105
	Negative staining	105
14	Cryofracture techniques: freeze fracture and freeze etching	107
	Cryofracture labelling	108
15	Scanning electron microscopy	109
	Acknowledgements	112
	References	112
4	Subcellular fractionation	113
	<i>Alois Hodel and J. Michael Edwardson</i>	
	1 Introduction	113
	2 Basic principles	113
	3 Choice of starting material	114
	4 Homogenization of tissue and cultured cells	114
	5 Fractionation by centrifugation	118
	Differential pelleting	119
	Velocity gradient centrifugation	119
	Isopycnic gradient centrifugation	120
	6 Free-flow electrophoresis	123
	7 Immunological methods of organelle purification	124
	Selection of antigen	124
	Selection of solid support	125
	Selection of coupling mode	125
	8 Monitoring purity	126
	9 Monitoring organelle structural integrity and activity	127
	Acknowledgement	130
	References	130

CONTENTS

5 Plant cell biology 133

Aldo Ceriotti, Nadine Paris, Stefan Hillmer, Lorenzo Frigerio, Jean-Marc Neuhaus, Alessandro Vitale, and David G. Robinson

- 1 Introduction 133
- 2 Expression and analysis of heterologous proteins in plant cells 134
 - Transient or permanent expression? 134
 - Tobacco mesophyll protoplasts 135
 - Choice of expression vector for transient expression 136
 - Preparation of DNA and amount used in transfection 137
 - Labelling of protoplasts 139
 - Protoplast subcellular fractionation 141
- 3 Immunolabelling, GFP, and confocal microscopy 143
 - Sample preparation for fluorescence immunostaining 143
 - Fluorescence immunolabelling 146
 - Confocal microscopy 148
 - GFP marker 149
- 4 Immunogold electron microscopy 151
 - General remarks 151
 - Assessing antigenic stability 151
 - Chemical fixation for immunocytochemical studies 153
 - Dehydration 154
 - Polymerization 156
 - Rapid freezing and freeze substitution 156
 - Immunogold labelling of acrylic sections 157
 - Preparation and immunogold labelling of cryosections 158
- References 161

6 Protein purification 163

Susan E. Slade and Howard Dalton

- 1 Introduction 163
- 2 General principles of protein purification 163
- 3 Determination of protein concentrations 164
 - Spectroscopic methods—UV absorption 165
 - Colorimetric dye-binding assays 165
- 4 Fractionation of proteins using adsorptive techniques 169
 - Fractionation by charge—ion exchange chromatography 169
 - Fractionation by hydrophobicity 172
 - Hydroxyapatite chromatography 174
 - Immobilized metal affinity chromatography (IMAC) 175
- 5 Affinity purification 177
 - Immobilized natural ligands 177
 - Group-specific adsorbents 178
- 6 Fractionation by size—gel filtration chromatography 182
- 7 Chromatofocusing 184
- 8 Purification of specific types of proteins 185
 - Purification of membrane proteins 185
 - Recombinant proteins 187

- 9 Example purification 189
 - Preparation of cell-free extract and ion exchange chromatography to fraction sMMO proteins 189
 - Gel filtration chromatography of hydroxylase protein 191
 - High resolution ion exchange purification of the hydroxylase 192
 - Separation of the hydroxylase subunits by reverse phase chromatography 192
- References 195
- Recommended reading 195

7 Gel electrophoresis of proteins 197

David E. Garfin

- 1 Introduction 197
- 2 Gel electrophoresis 198
 - Gels 199
 - Buffers 203
 - Pore-size gradient gels 214
 - Apparatus 215
 - Resolution and separation 218
 - Detergents 219
 - Choice of system 220
 - Sample preparation 221
 - Molecular mass estimation 223
 - Precast gels 225
- 3 Isoelectric focusing 227
 - Establishing pH gradients 228
 - Gels for isoelectric focusing 229
 - Power conditions and resolution in isoelectric focusing 232
 - Protein solubilization for isoelectric focusing 232
- 4 Two-dimensional gel electrophoresis 234
- 5 Detection of proteins in gels 237
 - Dye staining 239
 - Silver staining 241
 - Copper and zinc staining 243
 - Fluorescent stains 245
 - Detection of proteins in isoelectric focusing gels 246
- 6 Image acquisition and analysis 248
- 7 Blotting 249
 - Immunoblotting 249
- 8 Preparative gel electrophoresis 256
 - Extraction from gel slices 256
 - The whole gel eluter 259
 - Continuous elution electrophoresis 262
- Acknowledgements 265
- References 265

8 Biophysical methods in structural cell biology 269

Mavis Agbandje-McKenna, Arthur S. Edison, and Robert McKenna

- 1 Introduction 269

CONTENTS

- 2 Nuclear magnetic resonance spectroscopy 270
 - Sample preparation 272
 - Instrumentation hardware 273
 - Data acquisition and structure determination 273
- 3 X-ray crystallography 276
 - Sample preparation for crystallization experiments 277
 - Crystal growth 279
 - Cryo-cooling of crystals for data collection 282
 - Instrumentation hardware 283
 - Phasing of X-ray diffraction data 283
 - Structure determination 285
- 4 Electron microscopy 285
 - Sample preparation 286
 - Instrumentation hardware 288
 - Recording images, analysis, and reconstruction 288
- 5 The protein database 289
 - Suggested reading 289

9 Nucleic acids 293

T. A. Brown

- 1 Introduction 293
- 2 Purification of nucleic acids 293
- 3 The polymerase chain reaction 294
 - PCR in outline 295
 - Planning and carrying out a PCR 295
- 4 Agarose gel electrophoresis 299
 - DNA gels 299
 - RNA gels 302
- 5 Southern hybridization 303
 - The Southern blot 304
 - Hybridization analysis of a Southern blot 306
- 6 DNA sequencing 309
 - Sequencing PCR products 309
 - Thermal cycle sequencing of cloned DNA 311
- 7 Other DNA and RNA manipulations 312
 - Acknowledgements 315
 - References 315

10 Cell lipids: from isolation to functional dynamics 317

Robert Jan Veldman, Eve-Isabelle Pécheur, Sven C. D. van IJzendoorn, Jan Willem Kok, and Dick Hoekstra

- 1 Introduction 317
- 2 Analysis of cellular sphingolipids 318
 - Extraction and hydrolysis 318
 - Sphingolipid mass measurements 320
 - Sphingolipid analysis by metabolic radiolabelling 326

- 3 Sphingolipid trafficking in living cells 330
 - Incorporation of C₆-NBD-labelled sphingolipids into the plasma membrane of eukaryotic cells 332
 - Processing of membrane-inserted sphingolipid by endocytosis 335
 - Determination of recycling of internalized sphingolipids 335
 - Biosynthetic transport of C₆-NBD-labelled sphingolipids to the plasma membrane 336
- 4 Lipid vesicles and their use in studies of membrane fusion 338
 - Analysis of phospholipid purity 339
 - Preparation of liposomes, anchor lipid, and peptide-coupled vesicles 339
 - Fusion assay based upon lipid mixing 342
- References 345

11 Extracellular matrix protocols for the study of complex phenotypes 349

Calvin D. Roskelley and Shoukat Dedhar

- 1 Introduction 349
- 2 Mammary gland development *in vivo* 350
 - Embryonic development 350
 - Postnatal development 350
 - Lobulo-aveolar development 350
 - Involution 351
- 3 Mammary epithelial cell morphogenesis, differentiation, and apoptosis *in vitro* 351
- 4 Experimental models and approaches 351
 - Functional cell lines 351
 - Monolayer culture 352
 - Three-dimensional spheroidogenesis and differentiation 353
 - Extracellular matrix overlays 355
 - Cell shape 357
 - Differentiative integrin signalling 358
 - Suspension-mediated apoptosis 360
- References 361

12 The cytoskeleton 365

Theresia B. Stradal, Antonio S. Sechi, Jürgen Wehland, and Klemens Rottner

- 1 Introduction 365
 - Intermediate filaments 365
 - The actin cytoskeleton 366
 - The microtubule system 366
- 2 Visualization of the cytoskeleton 368
 - Plating of cells on different substrates 369
 - Localization of cytoskeletal components by indirect immunofluorescence microscopy 371
 - Cytoskeletal dynamics in living cells 374
 - Cytoskeletal drugs 379
- 3 Basic biochemical analysis of actin and actin binding proteins 379
 - Purification of actin from smooth muscle 379
 - Fluorescent labelling of purified proteins 382
 - Co-sedimentation of actin binding and bundling proteins with F-actin 383
 - Actin polymerization assay 385
