

CONTENTS

Some frequently used abbreviations

x

1 Introduction

1

What are "biophysical techniques"?

2

What questions can biophysical techniques answer?

2

Which technique to use?

3

Organization of this book

3

2 Molecular principles

5

2.1 Molecules and interactions

6

Introduction

6

Box 2.1 Atoms and elements

6

Box 2.2 Kinetic model of gases

7

Non-covalent interactions

7

Box 2.3 Electrostatics, dielectrics, and polarity

8

Box 2.4 Molecular biology tools and base pairing

11

Binding

11

3 Transport and heat

17

3.1 Diffusion, osmosis, viscosity, and friction

18

Introduction

18

Diffusion

18

Osmosis

19

Application of a force to a molecule in solution

21

Viscosity

21

Box 3.1 The frictional coefficient, f , depends on molecular shape

23

3.2 Analytical centrifugation

26

Introduction

26

Some basic principles of sedimentation

26

Sedimentation velocity

28

Sedimentation equilibrium

30

Density gradient sedimentation

31

3.3 Chromatography

36

Introduction

36

Theory

37

Chromatography techniques

38

Quantitative chromatography

40

3.4 Electrophoresis

44

Introduction

44

Theory

44

Experimental

45

Some electrophoresis systems

46

3.5 Mass spectrometry

55

Introduction

55

Ionization

55

Ion sorting/analysis

57

Applications of mass spectrometry

62

3.6 Electrophysiology

72

Introduction

72

Membrane potential

72

Action potentials

75

Experimental

76

Propagation of an action potential

79

in a neuron

79

3.7 Calorimetry

84

Introduction

84

Isothermal titration calorimetry

84

Differential scanning calorimetry

87

Box 3.2 Heat capacity

89

4 Scattering, refraction, and diffraction

93

4.1 Scattering of radiation

95

Introduction

95

Scattering theory

96

Box 4.1 Weight average molecular weight

97

Turbidity

97

Solution scattering and molecular shape

97

Box 4.2 Radii of gyration, R_G , and hydration, R_H

98

Dynamic light scattering

103

Box 4.3 Correlation functions

103

4.2 Refraction, evanescent waves, and plasmons

107

Introduction

107

Box 4.4 Classical optics

108

Evanescent waves

110

Surface plasmon resonance

111

Box 4.5 The streptavidin/biotin complex

114

4.3 Diffraction

119

Introduction

119

Principles of diffraction

119

Box 4.6 Single particle imaging with X-ray laser

119

Diffraction experiments

122

Interpretation of diffraction data

125

Other crystallography techniques

132

Achievements of crystallography

133

5 Electronic and vibrational spectroscopy	139		
5.1 Introduction to absorption and emission spectra	140		
Introduction	140		
Energy states	140		
Absorption	141		
Box 5.1 Transition dipole moments and transition probability	142		
Emission	144		
Box 5.2 The laser	145		
5.2 Infrared and Raman spectroscopy	148		
Introduction	148		
IR spectra and applications	150		
Raman scattering	155		
Applications of Raman spectroscopy	157		
5.3 Ultraviolet/visible spectroscopy	162		
Introduction	162		
Measurement of electronic spectra	162		
Electronic energy levels and transitions	163		
Absorption properties of some key chromophores	164		
Applications of UV/visible spectra	167		
Box 5.3 Isosbestic points	169		
Properties associated with the direction of the transition dipole moment	169		
Monitoring rapid reactions	171		
5.4 Optical activity	176		
Introduction	176		
The phenomenon	176		
Measurement	177		
Applications of CD spectra	178		
5.5 Fluorescence	185		
Introduction	185		
Physical basis of fluorescence	185		
Measurement	186		
Fluorophores	187		
Environmental effects on fluorescence	188		
Fluorescence anisotropy	191		
Förster resonance energy transfer (FRET)	193		
Exploitation of fluorescence sensitivity	196		
Box 5.4 Immunofluorescence	196		
Box 5.5 Fluorescence <i>in situ</i> hybridization (FISH)	196		
Phosphorescence	197		
5.6 X-ray spectroscopy	203		
Introduction	203		
Theory	203		
Measurement	204		
Edge spectra	205		
EXAFS	205		
Analytical uses of X-ray emission	206		
6 Magnetic resonance	209		
6.1 Nuclear magnetic resonance	210		
Introduction	210		
Box 6.1 Magnetism	210		
The NMR phenomenon	210		
		Measurement	212
		The spectral parameters in NMR	214
		Applications of NMR	223
		Other NMR applications	236
		6.2 Electron paramagnetic resonance	243
		Introduction	243
		Measurement	243
		Spectral parameters	244
		Box 6.2 Spin labels	246
		Spectral anisotropy	247
		Applications of EPR	248
		7 Microscopy and single molecule studies	257
		7.1 Microscopy	258
		Introduction	258
		Factors that influence resolution	259
		Box 7.1 Diffraction at a slit	259
		The optical microscope	260
		The fluorescence microscope	262
		Electron microscopy	266
		Box 7.2 X-ray tomography	270
		Box 7.3 The contrast transfer function (CTF)	272
		The scanning electron microscope	273
		Scanning probe microscopy	275
		7.2 Manipulation and observation of single molecules	279
		Introduction	279
		Manipulation by force	279
		Fluorescence methods	282
		8 Computational biology	289
		8.1 Computational biology	290
		Introduction	290
		Mathematical modeling of systems	290
		Bioinformatics	292
		Molecular modeling	296
		Box 8.1 Force and potential energy	298
		9 Tutorials	309
		1 Biological molecules	310
		2 Thermodynamics	312
		3 Motion and energy of particles in different force fields	314
		4 Electrical circuits	317
		5 Mathematical representation of waves	318
		6 Fourier series, Fourier transforms, and convolution	319
		7 Oscillators and simple harmonic motion	321
		8 Electromagnetic radiation	323
		9 Quantum theory and the Schrödinger wave equation	325
		10 Atomic and molecular orbitals, their energy states, and transitions	327
		11 Dipoles, dipole-dipole interactions, and spectral effects	330

Appendices**A1 Prefixes, units, and constants**

A1.1 Prefixes

A1.2 Units

A1.3 Constants

A2 Some mathematical functions

A2.1 Trigonometry

A2.2 Vectors

A2.3 Complex variables

332**332**

332

332

332

332

332

332

333

A2.4 Logarithms, exponentials,
and trigonometric functions

A2.5 Calculus

A3 Basic statistics**Solutions to Problems****Index**
