## Part 1 Introduction

### 1 Introduction

3

## Part 2 Theory of Small Angle Scattering

### 2 Theoretical Background

13

#### 2.1 Introduction

13

#### 2.2 Scattering Basics

13

#### 2.3 Multi-Scatterer Systems: The Debye Equation

19

#### 2.4 The Pair Distance Distribution Function, $P(r)$

21

#### 2.5 The Concept of Contrast in Solution Scattering

25

#### 2.6 Resolution and Information Content

29

#### 2.7 Summary

33

### 3 Quantities Directly Measurable by Scattering

35

#### 3.1 Introduction

35

#### 3.2 Invariants

35

#### 3.3 Global Characteristics of the $I(q)$ Curve

45

#### 3.4 Comparison of Invariants

51

#### 3.5 The Kratky Plot Distinguishes Globularity and Flexibility

51

#### 3.6 Summary

54

### 4 Shape Reconstructions from Small Angle Scattering Data

57

#### 4.1 Calculating Scattering Profiles from Three-Dimensional Models

58

#### 4.2 Ab Initio Modeling

64

#### 4.3 Flexible Fitting

69

#### 4.4 Rigid Body Modeling

70

#### 4.5 Docking Algorithms

70

#### 4.6 Mixtures

71

#### 4.7 Ensembles

72

#### 4.8 Hybrid Modeling

73

#### 4.9 Summary

73

**Part 3 Practical Aspects of Small Angle Scattering**

|          |                                                                                            |            |
|----------|--------------------------------------------------------------------------------------------|------------|
| <b>5</b> | <b>Before the Beamtime</b>                                                                 | <b>79</b>  |
| 5.1      | Sample Production                                                                          | 79         |
| 5.2      | Buffer Choice and Matching                                                                 | 80         |
| 5.3      | Sample Optimization                                                                        | 82         |
| 5.4      | Transport of the Sample                                                                    | 82         |
| 5.5      | Practical Preparations before Data Collection                                              | 83         |
| 5.6      | Quality Control Checks                                                                     | 84         |
| 5.7      | Contrast Matching for X-Ray and Neutron Cases                                              | 84         |
| 5.8      | Summary                                                                                    | 85         |
| <b>6</b> | <b>Making the Best Use of Beamtime</b>                                                     | <b>86</b>  |
| 6.1      | Sample-to-Detector Distance                                                                | 86         |
| 6.2      | Instrument Calibration                                                                     | 88         |
| 6.3      | Sample Concentration                                                                       | 89         |
| 6.4      | Number of Exposures/Exposure Time                                                          | 91         |
| 6.5      | Image Integration                                                                          | 91         |
| 6.6      | Buffer Collection and Subtraction                                                          | 93         |
| 6.7      | Initial Parameter Evaluation                                                               | 94         |
| 6.8      | The Guinier Plot                                                                           | 94         |
| 6.9      | Estimating the Radius of Gyration, $R_g$                                                   | 97         |
| 6.10     | Calculating the Pair Distance Distribution Function, $P(r)$                                | 98         |
| 6.11     | Estimating Forward Scattering, $I(0)$ , and Maximum<br>Dimension, $D_{max}$                | 99         |
| 6.12     | Assessing Flexibility                                                                      | 101        |
| 6.13     | Estimating Volume and Molecular Weight                                                     | 105        |
| 6.14     | Evaluating Radiation Damage and Concentration Dependence                                   | 106        |
| 6.15     | Assessing Accuracy of Buffer Subtraction                                                   | 107        |
| 6.16     | Summary                                                                                    | 109        |
| <b>7</b> | <b>Examples of Data Collection and Processing</b>                                          | <b>111</b> |
| 7.1      | Sample                                                                                     | 111        |
| 7.2      | Data                                                                                       | 112        |
| 7.3      | Checking Buffer Blanks                                                                     | 113        |
| 7.4      | Avoiding Radiation Damage                                                                  | 114        |
| 7.5      | Qualitative Comparison of Concentrations                                                   | 116        |
