<i>Foreword</i>	x		
1 Introduction to Molecular Biology of RNA	1		
1.1 Aims of this book	4		
1.2 DNA and RNA are composed of slightly different building blocks	4		
1.3 Nucleotides are joined together through a phosphodiester backbone to give nucleotide chains	8		
2 RNA can form versatile structures	11		
2.1 How do RNA molecules form structures?	11		
2.2 RNA secondary structure: RNA molecules tend to form a number of shorter helices compared with DNA	13		
2.3 RNA and DNA form different kinds of double helix	17		
2.4 Five common secondary structure motifs are found within RNA molecules	18		
2.5 RNA secondary structures can be worked out experimentally and predicted bioinformatically	19		
2.6 The formation of RNA helices is stimulated by positively charged molecules and particularly metal ions	23		
2.7 RNA molecules use a set of strategies to build tertiary structures	24		
2.8 Summary of how RNAs build structured molecules	27		
2.9 RNA structures can be used as thermosensors	27		
2.10 RNA structures can be selected which bind to target molecules	28		
2.11 Riboswitches are shape-changing RNAs which can flip gene expression patterns on binding specific target molecules	31		
3 Catalytic RNAs	36		
3.1 Three properties of RNA enable the catalytic function of ribozymes	36		
3.2 What kinds of reactions do ribozymes catalyse?	38		
3.3 Ribozymes were first discovered through serendipity	40		
3.4 Group I introns are spliced through a two-step mechanism which uses metal ions in their active sites	41		
3.5 Metal ions play a key role in catalysis by Group I introns	42		
3.6 Group II introns are also spliced through a two-step mechanism	43		
3.7 RNA is inherently chemically unstable because of its 2' -OH group	45		
3.8 Small ribonucleolytic ribozymes catalyse their own cleavage	46		
3.9 The hammerhead ribozyme	48		
3.10 The HDV ribozyme	50		
3.11 Are ribozymes true catalysts?	52		
3.12 The RNA world hypothesis: a time when RNA was used as a genetic material	52		
3.13 Experiments have been carried out that might model the early steps that might have occurred during the evolution of life	53		
4 The RNA-binding proteins	60		
4.1 The RNA recognition motif (RRM)	62		
4.2 The K-homology (KH) domain	65		
4.3 The cold-shock domain	66		
4.4 Double-stranded RNA-binding proteins	69		
4.5 The zinc-finger domain	71		
4.6 Other RNA-binding domains	73		
4.7 Investigating protein-RNA interactions	76		
5 Pre-mRNA splicing by the spliceosome	84		
5.1 RNA splicing was discovered in a virus	84		
5.2 Spliceosomal introns are critical for efficient eukaryotic gene expression	85		
5.3 Introns enhance eukaryotic gene expression at several levels	88		
5.4 Introns have an important role in evolution	89		
5.5 The mechanism of pre-mRNA splicing	90		
5.6 Splice sites	91		
5.7 The spliceosome	93		

5.8 Spliceosomes assemble and disassemble on each intron to be removed in a spliceosome cycle	94	7.5 How are mutations that cause splicing defects diagnosed?	144
5.9 How the spliceosome works	96	7.6 Diseases caused by mutations affecting components of the spliceosome	147
5.10 The spliceosome cycle has been worked out using in vitro extracts	100	7.7 Genes encoding important spliceosomal proteins are mutated in patients with the eye disease retinitis pigmentosa (RP)	148
5.11 A minor class of eukaryotic spliceosomal introns have different splice sites	101	7.8 The genes encoding splicing proteins can become mutated in some kinds of cancer	151
5.12 Spliceosomes can assemble through intron and exon definition	103	7.9 Splicing changes can change the properties of cancer cells	152
5.13 <i>Trans</i> -splicing is common in trypanosome parasites and in the nematode <i>C. elegans</i> , where it enables efficient translation	106	7.10 Diseases caused by mis-expression of levels of splicing factors	155
6 Regulated alternative splicing	111	7.11 Splicing as a target to treat cancer	158
6.1 There are several different types of alternative splicing	112	7.12 Manipulating pre-mRNA splicing offers a route to treating muscular dystrophy	158
6.2 How frequent is alternative splicing?	112	7.13 Splicing as a route to therapy for infectious diseases like AIDS	162
6.3 How exons are recognized by the splicing machinery	115	8 Co-transcriptional pre-mRNA processing	166
6.4 Exon and intron definition control the type of alternative splicing that operates	119	8.1 Transcription and the RNA polymerases	166
6.5 Three main factors can contribute to alternative splicing regulation	121	8.2 Formation of the ends of an mRNA	169
6.6 Regulation of RNA splicing is controlled by changes in the concentration of RNA-binding proteins	121	8.3 The C-terminal domain (CTD) of RNA polymerase II	172
6.7 Signal transduction pathways can regulate alternative splicing by changing the function and location of splicing factors	126	8.4 The links between splicing, transcription, and chromatin	173
6.8 Transcription elongation speeds can regulate alternative splicing choices	127	8.5 The spatial organization of pre-mRNA processing	178
6.9 Transcription can also modulate splicing pathways via the recruitment of cofactors	130	8.6 Histone mRNA 3' end formation	181
6.10 Alternative splicing is critical for normal animal development	130	9 Nucleocytoplasmic traffic of messenger RNA	186
6.11 RNA splicing regulators play a critical role in nervous system development in animals	134	9.1 Step 1: mRNAs are 'dressed for export' as they are synthesized by the addition of nuclear export adaptors	188
7 Pre-mRNA splicing defects in development and disease	138	9.2 Step 2: mRNA transcripts reach the nuclear pore by random nuclear diffusion	193
7.1 Mutations affecting the splicing code can be catastrophic for gene function	138	9.3 Step 3: Transit through the nuclear pore requires addition of nuclear export receptors	194
7.2 Mutations in splicing control sequences are very frequent causes of human genetic disease	140	9.4 Step 4: Disassembly of the export competent mRNP	199
7.3 Genetic mutations create a new splice site in a premature ageing disease	141	9.5 Step 5: Export receptors shuttle between the nucleus and the cytoplasm	200
7.4 Mutation of an exonic splicing enhancer in a DNA damage control gene leads to breast cancer	144	9.6 mRNA export can be hijacked by some viruses	201
		9.7 mRNA export can become defective in human diseases	202
		10 Messenger RNA localization	205
		10.1 The need for mRNA localization	205
		10.2 The machinery of mRNA localization	207
		10.3 Classical examples of mRNA localization in development	209

10.4	Localization of mRNA in differentiated somatic cells	212	13.11	RNA editing was discovered in trypanosomes by sequencing cDNAs encoded by mitochondrial genes	289
10.5	Localization of mRNA in algae and plants	217	13.12	Short RNAs called guide RNAs target trypanosome mitochondrial RNA editing	289
11	Translation of messenger RNA	222	13.13	Guide RNAs are used as a template for RNA editing through uridine insertions and deletions	291
11.1	What is translation?	222	13.14	Trypanosome mitochondrial RNA editing requires nuclear-encoded proteins which might be useful therapeutic targets	291
11.2	The structure and function of the ribosome	222	14	The biogenesis and nucleocytoplasmic traffic of non-coding RNAs	295
11.3	Deciphering the genetic code	224	14.1	The snoRNAs and scaRNAs: multiple roles in RNA biogenesis	296
11.4	The three phases of translation	229	14.2	Structure and function of the nucleolus	302
11.5	Regulation of mRNA translation	234	14.3	Processing of tRNA and of mitochondrial transcripts	304
11.6	Masked messages	240	14.4	SMN proteins and snRNP assembly	309
11.7	Manipulating translation	244	14.5	Nucleocytoplasmic traffic of non-coding RNA	314
12	Stability and degradation of mRNA	250	14.6	Retroviruses have hijacked the RNA export machinery to assist in the export of partially processed mRNAs	328
12.1	Messenger RNAs have a half-life	250	15	The 'macro' RNAs: long non-coding RNAs and epigenetics	334
12.2	Sites and mechanisms of mRNA degradation	252	15.1	Epigenetic regulation and the epigenetic code	334
12.3	The process of mRNA degradation	253	15.2	Long ncRNAs are involved in epigenetic gene regulation of gene expression	337
12.4	Extracellular stimuli influence the stability of mRNA	259	15.3	A long ncRNA called XIST epigenetically regulates the inactive X chromosome in female mammals	338
12.5	Nonsense-mediated, non-stop, and no-go mRNA decay	260	15.4	The X inactivation centre contains a number of non-coding RNAs as well as XIST	341
12.6	Degradation of mRNA in bacteria and plants	264	15.5	Non-placental mammals also use a long non-coding RNA to inactivate an X chromosome in females	342
13	RNA editing	268	15.6	Fruit flies use a long ncRNA to upregulate expression from a single male X chromosome	343
13.1	What is RNA editing and why might it exist?	268	15.7	The logic of dosage compensation strategies used in flies and mammals	344
13.2	A→I editing takes place by modification of adenosine through removal of an amino group	269	15.8	Genetic imprinting uses long non-coding RNAs	345
13.3	The biological consequences of A→I RNA editing: adenosine and inosine form different base pairs in RNA secondary structure	271	15.9	Transcription of the <i>H19</i> long non-coding RNA acts as a decoy for transcription of the <i>IGF2</i> gene	347
13.4	What does A→I mRNA editing do?	272	15.10	The <i>AIRN</i> ncRNA epigenetically represses <i>IGF2R</i> gene expression by directing epigenetic chromatin modification	348
13.5	A→I editing plays an important role in the function of tRNAs	279			
13.6	C→U RNA editing takes place through base deamination (removal of an amino group) of cytidine	281			
13.7	C→U RNA editing creates two different forms of the <i>APOB</i> mRNA in different tissues, and was the first RNA editing reaction to be discovered in animals	281			
13.8	<i>APOB</i> mRNAs are edited by an RNA editing complex containing the cytidine deaminase ApoBec1	283			
13.9	ApoBec proteins play an important role in innate immunity to retroviruses like HIV and in generating an antibody response	284			
13.10	Trypanosome mitochondrial RNA is edited by base insertions and deletions to create ORFs from frameshifted transcripts	287			

15.11 Long ncRNAs play an essential role in establishing animal body plans	349	16.5 Transcriptional silencing by non-coding RNAs in the centromere	376
15.12 Long ncRNAs are involved in transcriptional enhancer function	351	16.6 RNA-induced transcriptional silencing of transposons	379
15.13 Antisense RNAs	352		
16 The short non-coding RNAs and gene silencing	358	17 RNA biology: future perspectives	390
16.1 Key concepts and common pathways	358	17.1 The emergence of transcriptomics	390
16.2 Discovery and mechanism of RNA interference	363	17.2 The growing prominence of non-coding RNAs	393
16.3 The uses of RNA interference	366	17.3 RNA-guided genome editing	397
16.4 Discovery, biogenesis, and developmental roles of microRNAs	370	17.4 Concluding remarks	400
