In Memoriam: John Damuth xi
Preface xiii

CHAPTER 1. Selection Processes and Multispecies Systems 1

1.1 Prologue: Nonadaptive Selection 1
1.2 An Example: Why Food Chains Are Short 3
1.3 Goals at the Macroscale 4
1.4 The Problem of Extrapolation: Why Evolutionary Biology and Ecology Need Selective Processes in Addition to Natural Selection 6
1.5 The Macroscale 8
1.6 Nonadaptive Selection as a Solution 10

CHAPTER 2. Two Examples: Network Motifs and Damuth's Law 14

2.1 From Mechanisms to Patterns to Laws 14
2.2 Stability of Modules in Food Webs: Network Motifs 15
2.3 Selective Local Extinction and the Allometries of Energy and Abundance: Damuth's Law 22

CHAPTER 3. Nonadaptive Selection: How It Works 34

3.1 Nonadaptive Selection Is Distinct, Multifaceted, and Already Embedded in Evolutionary Theory 34
3.2 Nonadaptive Selection Processes: Do They Generate Laws of Nature? 47

3.3 The Properties of Macroscale Multispecies Systems 51

3.4 Summary 59

CHAPTER 4. Nonadaptive Selection at the Level of Single Species 60

4.1 Fisher's Principle: The Maintenance of Even Sex Ratios 60

4.2 Nonadaptive Selection Explanation of Heterozygote Fitness Superiority 62

CHAPTER 5. Nonadaptive Selection Explains the Size Scaling of Lifespans 66

5.1 Introduction: The Problem of Lifespan Scaling 66

5.2 Traditional Explanations 67

5.3 Physiology and Ecology Interact to Provide a Causal Explanation via Nonadaptive Selection 70

CHAPTER 6. Ecological Allometries, Nonadaptive Selection, and the Coordination of Powers 76

6.1 What Do Ecological Allometries Mean? 76

6.2 The Coordination of Ecological and Metabolic Power Laws 79

CHAPTER 7. Nonadaptive Selection in Multispecies Interaction Networks 85

7.1 Introduction: Observed, Lawlike Regularities in Multispecies Interactions Are the Result of Nonadaptive Selection 85

7.2 Consumer Interference 86

7.3 How Nonadaptive Selection Explains Short Trophic Chains 94

7.4 Qualitatively Stable Structures, Triangular Matrices, and Asymmetry of Interaction Strengths 98

7.5 Nonadaptive Selection and Predators Larger Than Their Prey 110

CHAPTER 8. Macroevolution: The Role of Nonadaptive Selection among Species 114

8.1 Introduction 114

8.2 Species Selection 115

8.3 Elevated Extinction Rates for Large Hypercarnivores 117

8.4 Outlook for Selection-Based Macroevolutionary Explanations and Laws 122

CHAPTER 9. Summary and Perspective 124

9.1 Life Elsewhere in the Universe 125

9.2 The Origin of Adaptation and the Zero-Force Law 125

9.3 Populating of the Biosphere with Stable Structures 126

9.4 Conclusion 127

CHAPTER 10. Appendices 129

10.1 Introduction to Allometry (Power Laws) 129

10.2 Qualitative Stability Conditions 132
10.3 Allometry and Energy Equivalence (Damuth's Law) 133
10.4 The Price Equation 139
10.5 Kepler's Planetary Allometry 143
10.6 Selection Analyses, Multilevel Selection, and Adaptation 146
10.7 Selection without Adaptation: A 2,300-Year History 150
10.8 Selection and Adaptation outside of Biology 153
10.9 Theories, Laws, and Models as Contemporary Philosophy Sees Them 156
10.10 Heterozygote Fitness Advantage 158
10.11 Models of Single-Species Population Growth 159
10.12 Community Interaction Networks, Asymmetry, and QSS 161
10.13 Species Selection: How the Concept of Species Selection Has Developed over the Last 50 Years, and Why It Still Doesn't Quite Work 169
10.14 What Nonadaptive Selection Is Not 179
