

CONTENTS

SECTION I

Fundamental Physicochemical Concepts

CHAPTER 1

INTRODUCTION: HOMEOSTASIS AND CELLULAR PHYSIOLOGY 1

Homeostasis Enables the Body to Survive in Diverse Environments..... 1

The Body Is an Ensemble of Functionally and Spatially Distinct Compartments..... 2

The Biological Membranes That Surround Cells and Subcellular Organelles Are Lipid Bilayers..... 2

Biomembranes Are Formed Primarily from Phospholipids but May Also Contain Cholesterol and Sphingolipids 3

Biomembranes Are Not Uniform Structures..... 3

Transport Processes Are Essential to Physiological Function 4

Cellular Physiology Focuses on Membrane-Mediated Processes and on Muscle Function..... 4

Summary..... 5

Key Words and Concepts 5

CHAPTER 2

DIFFUSION AND PERMEABILITY 7

Diffusion Is the Migration of Molecules down a Concentration Gradient..... 7

Fick's First Law of Diffusion Summarizes our Intuitive Understanding of Diffusion 7

Essential Aspects of Diffusion Are Revealed by Quantitative Examination of Random, Microscopic Movements of Molecules..... 9

Random Movements Result in Meandering..... 9

The Root-Mean-Squared Displacement Is a Good Measure of the Progress of Diffusion 10

Square-Root-of-Time Dependence Makes Diffusion Ineffective for Transporting Molecules Over Large Distances 10

Diffusion Constrains Cell Biology and Physiology 11

Fick's First Law Can Be Used to Describe Diffusion across a Membrane Barrier 11

The Net Flux Through a Membrane Is the Result of Balancing Influx Against Efflux..... 14

The Permeability Determines How Rapidly a Solute Can Be Transported Through a Membrane .. 14

Summary..... 18

Key Words and Concepts 18

Study Problems..... 18

CHAPTER 3

OSMOTIC PRESSURE
AND WATER MOVEMENT 19

Osmosis Is the Transport of *Solvent* Driven
by a Difference in *Solute* Concentration
Across a Membrane That Is Impermeable
to Solute..... 19

Water Transport during Osmosis Leads to
Changes in Volume..... 20

Osmotic Pressure Drives the Net
Transport of Water during Osmosis..... 20

Osmotic Pressure and Hydrostatic Pressure
Are Functionally Equivalent in Their
Ability to Drive Water Movement
Through a Membrane 22

*The Direction of Fluid Flow Through
the Capillary Wall Is Determined
by the Balance of Hydrostatic and
Osmotic Pressures as Described
by the Starling Equation..... 23*

Only Impermeant Solutes Can Have
Permanent Osmotic Effects..... 27

*Transient Changes in Cell Volume
Occur in Response to Changes in
the Extracellular Concentration
of Permeant Solutes 27*

*Persistent Changes in Cell Volume
Occur in Response to Changes in
the Extracellular Concentration
of Impermeant Solutes..... 29*

*The Amount of Impermeant Solute
Inside the Cell Determines the
Cell Volume..... 29*

Summary..... 31

Key Words and Concepts 32

Study Problems..... 32

CHAPTER 4

ELECTRICAL CONSEQUENCES
OF IONIC GRADIENTS 33

Ions Are Typically Present at Different
Concentrations on Opposite Sides
of a Biomembrane 33

Selective Ionic Permeability Through
Membranes Has Electrical Consequences:
The Nernst Equation 33

The Stable Resting Membrane Potential
in a Living Cell Is Established by
Balancing Multiple Ionic Fluxes..... 37

*Cell Membranes Are Permeable to
Multiple Ions..... 37*

*The Resting Membrane Potential
Can Be Quantitatively Estimated
by Using the Goldman-Hodgkin-
Katz Equation..... 39*

*A Permeant Ion Already in
Electrochemical Equilibrium Does
Not Need to Be Included in the
Goldman-Hodgkin-Katz Equation... 41*

*The Nernst Equation May Be Viewed
as a Special Case of the Goldman-
Hodgkin-Katz Equation..... 41*

*E_K Is the "Floor" and the E_{Na} Is the
"Ceiling" of Membrane Potential..... 42*

*The Difference Between the Membrane
Potential and the Equilibrium
Potential of an Ion Determines the
Direction of Ion Flow..... 42*

The Cell Can Change Its Membrane
Potential by Selectively Changing
Membrane Permeability to Certain Ions.... 42

The Donnan Effect Is an Osmotic
Threat to Living Cells 43

Summary..... 45

Key Words and Concepts 46

Study Problems..... 46

SECTION II

Ion Channels and Excitable Membranes**CHAPTER 5**

ION CHANNELS	47
Ion Channels Are Critical Determinants of the Electrical Behavior of Membranes ...	47
Distinct Types of Ion Channels Have Several Common Properties	48
<i>Ion Channels Increase the Permeability of the Membrane to Ions</i>	48
<i>Ion Channels Are Integral Membrane Proteins That Form Gated Pores</i>	49
<i>Ion Channels Exhibit Ionic Selectivity</i> ..	49
Ion Channels Share Structural Similarities and Can Be Grouped into Gene Families ...	50
<i>Channel Structure Is Studied with Biochemical and Molecular Biological Techniques</i>	50
<i>Structural Details of a K⁺ Channel Are Revealed by X-Ray Crystallography</i>	51
Summary	54
Key Words and Concepts	54
Study Problems	54

CHAPTER 6

PASSIVE ELECTRICAL PROPERTIES OF MEMBRANES	55
The Time Course and Spread of Membrane Potential Changes Are Predicted by the Passive Electrical Properties of the Membrane	55
The Equivalent Circuit of a Membrane Has a Resistor in Parallel with a Capacitor	56

<i>Membrane Conductance Is Established by Open Ion Channels</i>	56
<i>Capacitance Reflects the Ability of the Membrane to Separate Charge</i>	56
Passive Membrane Properties Produce Linear Current-Voltage Relationships	57
Membrane Capacitance Affects the Time Course of Voltage Changes	57
<i>Ionic and Capacitive Currents Flow When a Channel Opens</i>	57
<i>The Exponential Time Course of the Membrane Potential Can Be Understood in Terms of the Passive Properties of the Membrane</i>	59
Membrane and Axoplasmic Resistances Affect the Passive Spread of Subthreshold Electrical Signals	60
<i>The Decay of Subthreshold Potentials with Distance Can Be Understood in Terms of the Passive Properties of the Membrane</i>	61
<i>The Length Constant Is a Measure of How Far Away from a Stimulus Site a Membrane Potential Change Will Be Detectable</i>	63
Summary	63
Key Words and Concepts	64
Study Problems	64

CHAPTER 7

GENERATION AND PROPAGATION OF THE ACTION POTENTIAL	67
The Action Potential Is a Rapid and Transient Depolarization of the Membrane Potential in Electrically Excitable Cells	67
<i>Properties of Action Potentials Can Be Studied with Intracellular Microelectrodes</i>	67

Ion Channel Function Is Studied with a Voltage Clamp	69
<i>Ionic Currents Are Measured at a Constant Membrane Potential with a Voltage Clamp</i>	69
<i>Ionic Currents Are Dependent on Voltage and Time</i>	71
<i>Voltage-Gated Channels Exhibit Voltage-Dependent Conductances</i>	72
Individual Ion Channels Have Two Conductance Levels	74
Na ⁺ Channels Inactivate during Maintained Depolarization	75
Action Potentials Are Generated by Voltage-Gated Na ⁺ and K ⁺ Channels	76
<i>The Equivalent Circuit of a Patch of Membrane Can Be Used to Describe Action Potential Generation</i>	76
<i>The Action Potential Is a Cyclical Process of Channel Opening and Closing</i>	78
<i>Both Na⁺ Channel Inactivation and Open Voltage-Gated K⁺ Channels Contribute to the Refractory Period</i>	79
<i>Pharmacological Agents That Block Na⁺ or K⁺ Channels, or Interfere with Na⁺ Channel Inactivation, Alter the Shape of the Action Potential</i>	79
Action Potential Propagation Occurs as a Result of Local Circuit Currents	80
<i>In Nonmyelinated Axons an Action Potential Propagates as a Continuous Wave of Excitation Away from the Initiation Site</i>	80
<i>Conduction Velocity Is Influenced by the Time Constant, by the Length Constant, and by Na⁺ Current Amplitude and Kinetics</i>	81
<i>Myelination Increases Action Potential Conduction Velocity</i>	82

Summary	84
Key Words and Concepts	84
Study Problems	84

CHAPTER 8

ION CHANNEL DIVERSITY 87

Various Types of Ion Channels Help to Regulate Cellular Processes	87
Voltage-Gated Ca ²⁺ Channels Contribute to Electrical Activity and Mediate Ca ²⁺ Entry into Cells	87
<i>Ca²⁺ Currents Can Be Recorded with a Voltage Clamp</i>	88
<i>Ca²⁺ Channel Blockers Are Useful Therapeutic Agents</i>	90
Many Members of the Transient Receptor Potential Superfamily of Channels Mediate Ca ²⁺ Entry	91
<i>Some Members of the TRPC Family Are Receptor-Operated Channels</i>	91
K ⁺ -Selective Channels Are the Most Diverse Type of Channel	92
<i>Neuronal K⁺ Channel Diversity Contributes to the Regulation of Action Potential Firing Patterns</i>	92
<i>Rapidly Inactivating Voltage-Gated K⁺ Channels Cause Delays in Action Potential Generation</i>	93
<i>Ca²⁺-Activated K⁺ Channels Are Opened by Intracellular Ca²⁺</i>	95
<i>ATP-Sensitive K⁺ Channels Are Involved in Glucose-Induced Insulin Secretion from Pancreatic β-Cells</i>	95
<i>A Voltage-Gated K⁺ Channel Helps to Repolarize the Cardiac Action Potential</i>	97

Ion Channel Activity Can Be Regulated by Second-Messenger Pathways	97
<i>β-Adrenergic Receptor Activation Modulates L-Type Ca^{2+} Channels in Cardiac Muscle</i>	99
Summary	99
Key Words and Concepts	100
Study Problems	100

SECTION III

Solute Transport

CHAPTER 9

ELECTROCHEMICAL POTENTIAL ENERGY AND TRANSPORT PROCESSES	103
Electrochemical Potential Energy Drives All Transport Processes	103
<i>The Relationship Between Force and Potential Energy Is Revealed by Examining Gravity</i>	103
A Gradient in Chemical Potential Energy Gives Rise to a Chemical Force That Drives the Movement of Molecules	104
An Ion Can Have Both Electrical and Chemical Potential Energy	104
The Nernst Equation Is a Simple Manifestation of the Electrochemical Potential	104
How to Use the Electrochemical Potential to Analyze Transport Processes	108
Summary	111
Key Words and Concepts	111
Study Problems	111

CHAPTER 10

PASSIVE SOLUTE TRANSPORT	113
Diffusion across Biological Membranes Is Limited by Lipid Solubility	113
Channel, Carrier, and Pump Proteins Mediate Transport across Biological Membranes	114
<i>Transport Through Channels Is Relatively Fast</i>	114
Channel Density Controls the Membrane Permeability to a Substance	115
The Rate of Transport Through Open Channels Depends on the Net Driving Force	115
Transport of Substances Through Some Channels Is Controlled by "Gating" the Opening and Closing of the Channels	115
Carriers Are Integral Membrane Proteins That Open to Only One Side of the Membrane at a Time	115
Carriers Facilitate Transport Through Membranes	116
Transport by Carriers Exhibits Kinetic Properties Similar to Those of Enzyme Catalysis	116
Coupling the Transport of One Solute to the "Downhill" Transport of Another Solute Enables Carriers to Move the Cotransported or Countertransported Solute "Uphill" against an Electrochemical Gradient	119
<i>Na^+/H^+ Exchange Is an Example of Na^+-Coupled Countertransport</i>	119

Na^+ Is Cotransported with a Variety of Solutes Such as Glucose and Amino Acids	119
<i>How Does the Electrochemical Gradient for One Solute Affect the Gradient for a Cotransported Solute?</i>	121
<i>Glucose Uptake Efficiency Can Be Increased by a Change in the Na^+-Glucose Coupling Ratio</i>	121
Net Transport of Some Solutes across Epithelia Is Effected by Coupling Two Transport Processes in Series	122
<i>Various Inherited Defects of Glucose Transport Have Been Identified</i>	122
Na^+ Is Exchanged for Solutes Such as Ca^{2+} and H^+ by Countertransport Mechanisms	123
<i>$\text{Na}^+/\text{Ca}^{2+}$ Exchange Is an Example of Coupled Countertransport</i>	124
<i>$\text{Na}^+/\text{Ca}^{2+}$ Exchange Is Influenced by Changes in the Membrane Potential</i>	125
<i>$\text{Na}^+/\text{Ca}^{2+}$ Exchange Is Regulated by Several Different Mechanisms</i>	125
<i>Intracellular Ca^{2+} Plays Many Important Physiological Roles</i>	126
Multiple Transport Systems Can Be Functionally Coupled	126
<i>Tertiary Active Transport</i>	129
Summary	130
Key Words and Concepts	130
Study Problems	131

CHAPTER 11

ACTIVE TRANSPORT 133

Primary Active Transport Converts the Chemical Energy from ATP into Electrochemical Potential Energy Stored in Solute Gradients	133
---	-----

Three Broad Classes of ATPases Are Involved in Active Ion Transport	133
---	-----

The Plasma Membrane Na^+ Pump (Na^+ , K^+ -ATPase) Maintains the Low Na^+ and High K^+ Concentrations in the Cytosol	134
--	-----

Nearly All Animal Cells Normally Maintain a High Intracellular K^+ Concentration and a Low Intracellular Na^+ Concentration	134
---	-----

The Na^+ Pump Hydrolyzes ATP While Transporting Na^+ Out of the Cell and K^+ into the Cell	134
---	-----

The Na^+ Pump Is "Electrogenic"	135
--	-----

The Na^+ Pump Is the Receptor for Cardiotonic Steroids Such as Ouabain and Digoxin	135
---	-----

Intracellular Ca^{2+} Signaling Is Universal and Is Closely Tied to Ca^{2+} Homeostasis	136
---	-----

Ca^{2+} Storage in the Sarcoplasmic/Endoplasmic Reticulum Is Mediated by a Ca^{2+} -ATPase	139
--	-----

SERCA Has Three Isoforms	139
--------------------------------	-----

The Plasma Membrane of Most Cells Has an ATP-Driven Ca^{2+} Pump	140
---	-----

The Roles of the Several Ca^{2+} Transporters Differ in Different Cell Types	140
---	-----

Different Distributions of the NCX and PMCA in the Plasma Membrane Underlie Their Different Functions	140
---	-----

Several Other Plasma Membrane Transport ATPases Are Physiologically Important	141
---	-----

H^+ , K^+ -ATPase Mediates Gastric Acid Secretion	141
---	-----

Two Cu^{2+} -Transporting ATPases Play Essential Physiological Roles.....	142
ATP-Binding Cassette Transporters Are a Superfamily of P-Type ATPases	144
Net Transport across Epithelial Cells Depends on the Coupling of Apical and Basolateral Membrane Transport Systems	145
Epithelia Are Continuous Sheets of Cells.....	145
Epithelia Exhibit Great Functional Diversity.....	145
What Are the Sources of Na^+ for Apical Membrane Na^+ -Coupled Solute Transport?.....	147
Absorption of Cl^- Occurs by Several Different Mechanisms	148
Substances Can Also Be Secreted by Epithelia.....	149
Net Water Flow Is Coupled to Net Solute Flow across Epithelia.....	150
Summary.....	153
Key Words and Concepts	153
Study Problems.....	154

SECTION IV

Physiology of Synaptic Transmission

CHAPTER 12

SYNAPTIC PHYSIOLOGY I 155

The Synapse Is a Junction Between Cells That Is Specialized for Cell-Cell Signaling.....	155
Synaptic Transmission Can Be Either Electrical or Chemical.....	156
Electrical Synapses Are Designed for Rapid Synchronous Transmission...	156
Most Synapses Are Chemical Synapses...	157

Neurons Communicate with Other Neurons and with Muscle by Releasing Neurotransmitters.....	159
The Neuromuscular Junction Is a Large Chemical Synapse.....	160
Transmitter Release at Chemical Synapses Occurs in Multiples of a Unit Size	162
Ca^{2+} Ions Play an Essential Role in Transmitter Release	164
The Synaptic Vesicle Cycle Is a Precisely Choreographed Process for Delivering Neurotransmitter into the Synaptic Cleft	166
The Synaptic Vesicle Is the Organelle That Concentrates, Stores, and Delivers Neurotransmitter at the Synapse	167
Neurotransmitter-Filled Synaptic Vesicles Dock at the Active Zone and Become "Primed" for Exocytosis	167
Binding of Ca^{2+} Ions to Synaptotagmin Triggers the Fusion and Exocytosis of the Synaptic Vesicle.....	169
Retrieval of the Fused Synaptic Vesicle Back into the Nerve Terminal Can Occur Through Clathrin-Independent and Clathrin-Dependent Mechanisms.....	171
Short-Term Synaptic Plasticity Is a Transient, Use-Dependent Change in the Efficacy of Synaptic Transmission ...	174
Summary.....	177
Key Words and Concepts	178
Study Problems.....	179

CHAPTER 13

SYNAPTIC PHYSIOLOGY II 181

Chemical Synapses Afford Specificity, Variety, and Fine Tuning of Neurotransmission.....	181
What Is a Neurotransmitter?	181

Receptors Mediate the Actions of Neurotransmitters in Postsynaptic Cells...184	Epinephrine and Norepinephrine Exert Central and Peripheral Effects by Activating Two Classes of Receptors 197
<i>Conventional Neurotransmitters Activate Two Classes of Receptors: Iontropic Receptors and Metabotropic Receptors.....</i>	Dopaminergic Transmission Is Important for the Coordination of Movement and for Cognition 198
..... 184	Serotonergic Transmission Is Important in Emotion and Behavior..... 199
Acetylcholine Receptors Can Be Iontropic or Metabotropic..... 186	Histamine Serves Diverse Central and Peripheral Functions..... 200
<i>Nicotinic Acetylcholine Receptors Are Iontropic.....</i>	ATP Is Frequently Coreleased with Other Neurotransmitters 200
..... 186	Neuropeptide Transmitters Are Structurally and Functionally Diverse 201
<i>Muscarinic Acetylcholine Receptors Are Metabotropic.....</i>	Unconventional Neurotransmitters Modulate Many Complex Physiological Responses 202
..... 186	<i>Unconventional Neurotransmitters Are Secreted in Nonquantal Fashion202</i>
Amino Acid Neurotransmitters Mediate Many Excitatory and Inhibitory Responses in the Brain 187	<i>Many Effects of Nitric Oxide and Carbon Monoxide Are Mediated Locally by Soluble Guanylyl Cyclase 202</i>
<i>Glutamate Is the Main Excitatory Neurotransmitter in the Brain.....</i>	<i>Endocannabinoids Can Mediate Retrograde Neurotransmission 202</i>
..... 187	Long-Term Synaptic Potentiation and Depression Are Persistent Changes in the Efficacy of Synaptic Transmission Induced by Neural Activity 203
<i>γ-Aminobutyric Acid and Glycine Are the Main Inhibitory Neurotransmitters in the Nervous System 188</i>	<i>Long-Term Potentiation Is a Long-Lasting Increase in the Efficacy of Transmission at Excitatory Synapses..... 203</i>
Neurotransmitters That Bind to Iontropic Receptors Cause Membrane Conductance Changes 189	<i>Long-Term Depression Is a Long-Lasting Decrease in the Efficacy of Transmission at Excitatory Synapses..... 205</i>
<i>At Excitatory Synapses, the Reversal Potential Is More Positive Than the Action Potential Threshold.....</i>	Summary..... 206
..... 190	Key Words and Concepts 207
<i>NMDAR and AMPAR Are Channels with Different Ion Selectivities and Kinetics 191</i>	Study Problems..... 208
<i>Sustained Application of Agonist Causes Desensitization of Iontropic Receptors.....</i>	
..... 192	
<i>At Inhibitory Synapses, the Reversal Potential Is More Negative Than the Action Potential Threshold 193</i>	
<i>Temporal and Spatial Summation of Postsynaptic Potentials Determine the Outcome of Synaptic Transmission.....</i>	
..... 195	
<i>Synaptic Transmission Is Terminated by Several Mechanisms.....</i>	
..... 196	
Biogenic Amines, Purines, and Neuropeptides Are Important Classes of Transmitters with a Wide Spectrum of Actions..... 197	

SECTION V

Molecular Motors and Muscle Contraction

CHAPTER 14

MOLECULAR MOTORS AND THE MECHANISM OF MUSCLE CONTRACTION... 211

Molecular Motors Produce Movement by Converting Chemical Energy into Kinetic Energy.....	211
<i>The Three Types of Molecular Motors Are Myosin, Kinesin, and Dynein...</i>	211
Single Skeletal Muscle Fibers Are Composed of Many Myofibrils.....	212
The Sarcomere Is the Basic Unit of Contraction in Skeletal Muscle.....	212
<i>Sarcomeres Consist of Interdigitating Thin and Thick Filaments.....</i>	212
<i>Thick Filaments Are Composed Mostly of Myosin.....</i>	214
<i>Thin Filaments in Skeletal Muscle Are Composed of Four Major Proteins: Actin, Tropomyosin, Troponin, and Nebulin.....</i>	214
Muscle Contraction Results from Thick and Thin Filaments Sliding Past Each Other (The "Sliding Filament" Mechanism)....	215
The Cross-Bridge Cycle Powers Muscle Contraction.....	216
In Skeletal and Cardiac Muscles, Ca^{2+} Activates Contraction by Binding to the Regulatory Protein Troponin C.....	218
The Structure and Function of Cardiac Muscle and Smooth Muscle Are Distinctly Different from Those of Skeletal Muscle.....	220
<i>Cardiac Muscle Is Striated.....</i>	220
<i>Cardiac Muscle Cells Require a Continuous Supply of Energy.....</i>	220

<i>To Enable the Heart to Act as a Pump, Myocytes Comprising Each Chamber Must Contract Synchronously.....</i>	220
<i>Smooth Muscles Are Not Striated.....</i>	220
<i>In Smooth Muscle, Elevation of Intracellular Ca^{2+} Activates Contraction by Promoting the Phosphorylation of the Myosin Regulatory Light Chain.....</i>	223
Summary.....	226
Key Words and Concepts.....	227
Study Problems.....	227

CHAPTER 15

EXCITATION-CONTRACTION COUPLING IN MUSCLE..... 229

Skeletal Muscle Contraction Is Initiated by a Depolarization of the Surface Membrane.....	229
<i>Skeletal Muscle Has a High Resting Cl^- Permeability.....</i>	230
<i>A Single Action Potential Causes a Brief Contraction Called a Twitch.....</i>	230
<i>How Does Depolarization Increase Intracellular Ca^{2+} in Skeletal Muscle?.....</i>	230
Direct Mechanical Interaction Between Sarcolemmal and Sarcoplasmic Reticulum Membrane Proteins Mediates Excitation-Contraction Coupling in Skeletal Muscle.....	231
<i>In Skeletal Muscle, Depolarization of the T-Tubule Membrane Is Required for Excitation-Contraction Coupling.....</i>	231
<i>In Skeletal Muscle, Extracellular Ca^{2+} Is Not Required for Contraction.....</i>	232
<i>In Skeletal Muscle, the Sarcoplasmic Reticulum Stores All the Ca^{2+} Needed for Contraction.....</i>	232

<i>The Triad Is the Structure That Mediates Excitation-Contraction Coupling in Skeletal Muscle</i>	233
<i>In Skeletal Muscle, Excitation- Contraction Coupling Is Mechanical</i>	235
<i>Skeletal Muscle Relaxes When Ca^{2+} Is Returned to the Sarcoplasmic Reticulum by SERCA</i>	235
<i>Ca^{2+}-Induced Ca^{2+} Release Is Central to Excitation-Contraction Coupling in Cardiac Muscle</i>	237
<i>In Cardiac Muscle, Communication Between the Sarcoplasmic Reticulum and Sarcolemma Occurs at Dyads and Peripheral Couplings</i>	237
<i>Cardiac Excitation-Contraction Coupling Requires Extracellular Ca^{2+} and Ca^{2+} Entry Through L-Type Ca^{2+} Channels (Dihydropyridine Receptors)</i>	238
<i>Ca^{2+} That Enters the Cell during the Cardiac Action Potential Must Be Removed to Maintain a Steady State</i>	240
<i>Cardiac Contraction Can Be Regulated by Altering Intracellular Ca^{2+}</i>	240
<i>Smooth Muscle Excitation-Contraction Coupling Is Fundamentally Different from That in Skeletal and Cardiac Muscles</i>	241
<i>Smooth Muscles Are Highly Diverse</i> ...	241
<i>The Density of Innervation Varies Greatly among Different Types of Smooth Muscles</i>	241
<i>Some Smooth Muscles Are Normally Activated by Depolarization</i>	242
<i>Some Smooth Muscles Can Be Activated without Depolarization by Pharmacomechanical Coupling</i>	243
<i>Ca^{2+} Signaling, Ca^{2+} Sensitivity, and Ca^{2+} Balance in Smooth Muscle May Be Altered Under Physiological and Pathophysiological Conditions</i>	245

Summary	246
Key Words and Concepts	247
Study Problems	247

CHAPTER 16

MECHANICS OF MUSCLE CONTRACTION 249

<i>The Total Force Generated by a Skeletal Muscle Can Be Varied</i>	249
<i>Whole Muscle Force Can Be Increased by Recruiting Motor Units</i>	249
<i>A Single Action Potential Produces a Twitch Contraction</i>	249
<i>Repetitive Stimulation Produces Fused Contractions</i>	251
<i>Skeletal Muscle Mechanics Is Characterized by Two Fundamental Relationships</i>	252
<i>The Sliding Filament Mechanism Underlies the Length-Tension Curve</i>	253
<i>In Isotonic Contractions, Shortening Velocity Decreases as Force Increases</i>	255
<i>There Are Three Types of Skeletal Muscle Motor Units</i>	255
<i>The Force Generated by Cardiac Muscle Is Regulated by Mechanisms That Control Intracellular Ca^{2+}</i>	257
<i>Cardiac Muscle Generates Long- Duration Contractions</i>	257
<i>Total Force Developed by Cardiac Muscle Is Determined by Intracellular Ca^{2+}</i>	257
<i>Mechanical Properties of Cardiac and Skeletal Muscle Are Similar but Quantitatively Different</i>	259
<i>Cardiac and Skeletal Muscles Have Similar Length-Tension Relationships</i>	259

<i>The Contractile Force of the Intact Heart Is a Function of Initial (End-Diastolic) Volume</i>	259
<i>Shortening Velocity Is Slower in Cardiac Than in Skeletal Muscle</i>	260
Dynamics of Smooth Muscle Contraction Differ Markedly from Those of Skeletal and Cardiac Muscle	260
<i>Three Key Relationships Characterize Smooth Muscle Function</i>	260
<i>The Length-Tension Relationship in Smooth Muscles Is Consistent with the Sliding Filament Mechanism of Contraction</i>	260
<i>The Velocity of Shortening Is Much Lower in Smooth Muscle Than in Skeletal Muscle</i>	261
<i>Single Actin-Myosin Molecular Interactions Reveal How Smooth and Skeletal Muscles Generate the Same Amount of Stress Despite Very Different Shortening Velocities</i>	261
<i>Velocity of Smooth Muscle Shortening and the Amount of Stress Generated Depend on the Extent of Myosin Light Chain Phosphorylation</i>	263
<i>The Kinetic Properties of the Cross-Bridge Cycle Depend on the Myosin Isoforms Expressed in the Myocytes</i>	263
The Relationships among Intracellular Ca^{2+} , Myosin Light Chain Phosphorylation, and Force in Smooth Muscles Is Complex	264
<i>Tonic Smooth Muscles Can Maintain Tension with Little Consumption of ATP</i>	264
<i>Perspective: Smooth Muscles Are Functionally Diverse</i>	265
Summary	267
Key Words and Concepts	268
