

Contents

Preface	xvii
Acknowledgements	xix
Section I Foundations of Phylogenomics	
Chapter 1 What is Phylogenomics?	3
Chapter 2 The Biology and Sequencing of Genetic Information: DNA, RNA, and Proteins	15
Chapter 3 Evolutionary Principles: Populations and Trees	33
Section II Data	
Chapter 4 Data Storage—The Basics	49
Chapter 5 Sequence Alignment and Searching Sequence Databases	63
Chapter 6 Multiple Alignments	81
Chapter 7 Genome Sequencing and Annotation	91
Chapter 8 Genomics Databases: Genomes and Transcriptomes	101
Chapter 9 Amplicon Databases: BoLD and Bacterial 16S rDNA Databases	115
Section III Phylogenetic/Phylogenomic Analysis	
Chapter 10 Introduction to Tree Building	131
Chapter 11 Distance and Clustering	145
Chapter 12 Maximum Likelihood	157
Chapter 13 Search Strategies and Robustness	167
Chapter 14 Rate Heterogeneity, Long Branch Attraction, and Likelihood Models	177
Chapter 15 Bayesian Approaches in Phylogenetics	187
Chapter 16 Incongruence of Gene Trees	199
Chapter 17 Phylogenetic Programs and Websites	213

Section IV Population Genomics

Chapter 18	Population Genetics and Genomes	225
Chapter 19	Population Genomics Approaches	245
Chapter 20	Detecting Natural Selection: The Basics	263
Chapter 21	Refining the Approach to Natural Selection at the Molecular Level	277

Section V Phylogenomics in Action

Chapter 22	Constructing Phylogenomic Matrices	295
Chapter 23	Phylogenomics and the Tree of Life	311
Chapter 24	Comparative Genomics	331
Chapter 25	Environmental DNA (eDNA)	347
Chapter 26	Phylogenomic Approaches to Understanding Gene Function and Evolution	359

Index		373
