

# Contents

|                |      |
|----------------|------|
| Series Preface | vii  |
| Preface        | ix   |
| Editors        | xi   |
| Contributors   | xiii |

## PART I HISTORY AND PERSPECTIVE 1

- |                                         |   |
|-----------------------------------------|---|
| 1. Introduction to fluorescent proteins | 3 |
| <i>Marc Zimmer</i>                      |   |

## PART II PHOTOPHYSICAL PROPERTIES OF FLUORESCENT PROTEINS 25

- |                                                                         |     |
|-------------------------------------------------------------------------|-----|
| 2. Lessons learned from structural studies of fluorescent proteins      | 27  |
| <i>S. James Remington</i>                                               |     |
| 3. Optimization of fluorescent proteins                                 | 53  |
| <i>Mark A. Rizzo</i>                                                    |     |
| 4. Development of new colors from coral fluorescent proteins            | 71  |
| <i>Nathan C. Shaner</i>                                                 |     |
| 5. Red fluorescent proteins: Multipurpose markers for live-cell imaging | 97  |
| <i>Jörg Wiedenmann and G. Ulrich Nienhaus</i>                           |     |
| 6. Optical highlighter photophysical properties                         | 123 |
| <i>George H. Patterson</i>                                              |     |
| 7. Far-red and near-infrared fluorescent proteins                       | 157 |
| <i>Jun Chu, Yan Xing, and Michael Z. Lin</i>                            |     |

## PART III APPLICATIONS 175

- |                                                                                    |     |
|------------------------------------------------------------------------------------|-----|
| 8. Genetically encoded fluorescent proteins and FRAP                               | 177 |
| <i>Davide Mazza and James G. McNally</i>                                           |     |
| 9. Optical highlighters: Applications to cell biology                              | 201 |
| <i>Malte Renz and Jennifer Lippincott-Schwartz</i>                                 |     |
| 10. Optogenetic tools derived from plant photoreceptors                            | 229 |
| <i>John M. Christie</i>                                                            |     |
| 11. Fluorescent proteins for FRET: Monitoring protein interactions in living cells | 245 |
| <i>Richard N. Day</i>                                                              |     |

|                                                                     |     |
|---------------------------------------------------------------------|-----|
| 12. Superresolution techniques using fluorescent protein technology | 279 |
| <i>John R. Allen, Michael W. Davidson, and Stephen T. Ross</i>      |     |
| 13. <i>In vivo</i> imaging revolution made by fluorescent proteins  | 309 |
| <i>Robert M. Hoffman</i>                                            |     |
| Index                                                               | 325 |
