

Contents

I	Statistical Mechanics	xiii
1	Equilibrium Statistical Mechanics	1
1.1	Z: The partition function	1
1.2	Relation to thermodynamics	5
1.3	Computing Z	11
2	Nonequilibrium Statistical Mechanics	41
2.1	Stochastic processes	42
2.2	The master equation	44
2.3	Fluctuation theorems	49
2.4	The Fokker-Planck and Langevin equations	56
2.5	Sequence alignment: a nonequilibrium phase transition . . .	68
II	Biomolecules	81
1	Molecules, Code and Representation	83
1.1	DNA and RNA: the building blocks	83
1.2	Representing RNA structure	88
1.3	Proteins	92
2	DNA	97
2.1	Thermal stability of DNA: the melting transition	97
2.2	The melting profiles of genomic DNA and cDNA	108
2.3	Hybridizing DNA	117
3	RNA	129
3.1	Computing RNA secondary structure: combinatorics	129
3.2	The RNA partition function	133
3.3	RNA phase behaviour and folding kinetics	139
4	Proteins	149
4.1	Proteins: folding	149
4.2	Proteins: docking	156
4.3	Electrostatics	158
4.4	Chromatin	167
4.5	Bacterial chemotaxis: cooperativity once more	173

1 Network Dynamics I: Deterministic	185
1.1 Deterministic dynamics: λ -repressor expression	186
1.2 The Turing insight	194
1.3 The Min system	197
2 Network Dynamics II: Fluctuations	207
2.1 Noise in signalling	207
2.2 Stochastic cascades	210
2.3 Stochastic focusing	215
2.4 Fluctuating gene network dynamics	217
2.5 Extrinsic vs. intrinsic noise	222
3 Networks: Structure	229
3.1 Networks as graphs	229
3.2 Probability generating functions and network characteristics	232
3.3 Statistical mechanics of networks	235
3.4 Network growth	237
Index	247
