Preface to the Second Edition

1. Introduction: A New Ecology Is Needed

- 1.1 Environmental Management has Changed
- 1.2 Ecology Is Changing
- 1.3 A New Ecology
- 1.4 Book Outline

2. Ecosystems Have Thermodynamic Openness

- 2.1 Why Must Ecosystems Be Open?
- 2.2 An Isolated System Would Die (Maximum Entropy)
- 2.3 Physical Openness
- 2.4 The Second Law of Thermodynamics Interpreted for Open Systems
- 2.5 Dissipative Structure
- 2.6 Quantification of Openness and Allometric Principles
- 2.7 The Cell
- 2.8 What About the Environment?
- 2.9 Conclusion

3. Ecosystems Have Ontic Openness

- 3.1 Introduction
- 3.2 Why Is Ontic Openness so Obscure?
- 3.3 Ontic Openness and the Physical World
- 3.4 What Really Differs Between Physics and Biology: Four Principles of Elsasser
- 3.5 Ontic Openness and Relative Stability
- 3.6 The Macroscopic Openness—Connections to Thermodynamics
- 3.7 Ontic Openness and Emergence
- 3.8 Ontic Openness and Hierarchies
- 3.9 Messages from Ontic Openness to Ecology and Ecologists/Managers
- 3.10 Consequences of Ontic Openness: a Tentative Conclusion

4. Ecosystems Have Connectivity

- 4.1 Introduction
- 4.2 Ecosystems as Networks

- ix 4.3 Food Webs
- 4.4 Systems Analysis
- 4.5 Ecosystem Connectivity and Ecological Network Analysis
- 4.6 Network Environ Analysis Primer
- 4.7 The Cardinal Hypotheses of Network Environ Analysis
- 4.8 Conclusions

5. Ecosystems as Self-organizing Hierarchies

- 5.1 History of Hierarchy Concepts in Ecology
- 5.2 Hierarchies Inherent in Biology
- 5.3 Classical Hierarchies in Time and Space
- 5.4 Hierarchical Features: Boundaries, Gradients, and Constraints
- 5.5 Understanding Hierarchical Function
- 5.6 Managing Ecosystems as Hierarchies

6. Ecosystems Have Directionality

- 6.1 Since the Beginnings of Ecology
- 6.2 The Challenge from Thermodynamics
- 6.3 Deconstructing Directionality?
- 6.4 Agencies Imparting Directionality
- 6.5 Origins of Evolutionary Drive
- 6.6 Quantifying Directionality in Ecosystems
- 6.7 Demystifying Darwin
- 6.8 Directionality in Evolution?
- 6.9 Summary

7. Ecosystems Have Complex Dynamics—Growth and Development

- Preamble
- 7.1 Variability in Life Conditions
- 7.2 Ecosystem Development
- 7.3 Orientors and Succession Theories
- 7.4 The Maximum Power Principle
- 7.5 Exergy, Ascendancy, Gradients, and Ecosystem Development
- 7.6 Support for the Presented Hypotheses
- 7.7 Toward a Consistent Ecosystem Theory
- 7.8 Summary and Conclusions

8. Ecosystems Have Complex Dynamics— Disturbance and Decay	10.4	Applications of Network Analysis and Ascendency to South Florida Ecosystems	191
8.1 The Normality of Disturbance	139	10.5 The Application of Eco-exergy as Ecological Indicator for Assessment of Ecosystem Health	197
8.2 The Risk of Orientor Optimization	145	10.6 Emergy as Ecological Indicator to Assess Ecosystem Health	200
8.3 The Characteristics of Disturbance	145	10.7 The Eco-exergy to Empower Ratio and the Efficiency of Ecosystems	205
8.4 Adaptability as a Key Function of Ecosystem Dynamics	149	10.8 Application of Eco-exergy and Ascendency as Ecological Indicator to the Mondego Estuary (Portugal)	207
8.5 Adaptive Cycles on Multiple Scales	152	10.9 Conclusions	214
8.6 A Case Study: Human Disturbance and Retrogressive Dynamics	155	11. Ecosystems Carry Important Messages to Managers and Policy Makers	
8.7 Summary and Conclusions	157	11.1 Ecosystems in A Sustainability Perspective	215
9. Ecosystem Principles Have Broad Explanatory Power in Ecology	159	11.2 Management with Nature	216
9.1 Introduction	159	11.3 Indicating Management Success	219
9.2 Do Ecological Principles Encompass Other Proposed Ecological Theories?	160	11.4 Conclusions	234
9.3 Evolutionary Theory in the Light of Ecosystem Principles	164	12. Conclusions and Final Remarks	
9.4 Latitudinal Gradients in Biodiversity in the Light of Ecosystem Principles	170	12.1 Are Fundamental Ecological Properties Needed to Explain Our Observations?	235
9.5 The Keystone Species Hypothesis in the Light of Ecosystem Principles	172	12.2 Previous Attempts to Present an Ecosystem Theory	235
9.6 Liebig's Law of the Minimum	177	12.3 Recapitulation of the Phenomenological Ecosystem Theory	236
9.7 The River Continuum Theory in the Light of Ecosystem Principles	180	12.4 Are There Basic Ecosystem Principles?	237
9.8 Conclusions	181	12.5 Conclusion	238
10. Ecosystem Principles Have Ecological Applications		References	241
10.1 Introduction	183	Index	257
10.2 Entropy Production as an Indicator of Ecosystem Trophic State	183		
10.3 The Use of Ecological Network Analysis for the Simulation of the Interactions Between American Black Bear and Its Environment	189
