Chapter 1 Concepts Through Time: Historical Perspectives on Mammalian Locomotion	1
<i>John E. A. Bertram</i>	
1.1 Introduction	1
1.2 The ancients and the contemplation of motion	2
1.3 The European Renaissance and foundations of the age of discovery	3
1.4 The era of technological observation	5
1.5 Physiology and mechanics of terrestrial locomotion – cost and consequences	7
1.6 Comparative studies of gait	10
1.6 Re-interpreting the mechanics: A fork in the road, or simply seeing the other side of the coin?	13
1.7 The biological source of cost	13

1.8	The physical source of cost (with biological consequences) – the road less traveled.....	14
1.9	Conclusions.....	21
	References	21
Chapter 2	Considering Gaits: Descriptive Approaches.....	27
	<i>John E. A. Bertram</i>	
2.1	Introduction	27
2.2	Defining the fundamental gaits.....	28
2.3	Classifying and comparing the fundamental gaits.....	30
2.4	Symmetric gaits.....	32
2.5	Asymmetric gaits.....	34
2.6	Beyond “Hildebrand plots”.....	40
2.7	Statistical classification	43
2.8	Neural regulation and emergent criteria.....	45
2.9	Mechanical measures as descriptions of gaits	47
2.10	Conclusion	47
	References	48
Chapter 3	Muscles as Actuators.....	51
	<i>Anne K. Gutmann and John E. A. Bertram</i>	
3.1	Introduction	51
3.2	Basic muscle operation	52
3.2.1	Sliding filament theory – the basis for cross-bridge theory	52
3.2.2	Basic cross-bridge theory.....	52
3.2.3	Multi-state cross-bridge models	57
3.3	Some alternatives to cross-bridge theory.....	59
3.4	Force production	60
3.4.1	Isometric force production	60
3.4.2	Non-isometric force production.....	63
3.5	The Hill-type model.....	66
3.6	Optimizing work, power, and efficiency.....	68
3.7	Muscle architecture.....	70
3.7.1	The sarcomere as the fundamental contractile unit.....	70
3.7.2	Muscle geometry	70
3.7.3	Elastic energy storage and return.....	72
3.7.4	Damping/energy dissipation	72
3.8	Other factors that influence muscle performance.....	73
3.8.1	Fiber type	73
3.9	Activation and recruitment	75
3.10	What does muscle do best?	76
	References	76

Chapter 4 Concepts in Locomotion: Levers, Struts, Pendula and Springs 79

John E. A. Bertram

4.1	Introduction.....	79
4.2	The limb: How details can obscure functional role	83
4.3	Limb function in stability and the concept of the “effective limb”	85
4.3.1	Considering the mechanisms of stability	85
4.3.2	The role of the effective limb	88
4.4	Levers and struts.....	89
4.5	Ground reaction force in gaits	92
4.5.1	Trot	94
4.5.2	Walk.....	96
4.5.3	Gallop.....	97
4.6	The consequence of applied force: CoM motion, pendula and springs	98
4.7	Energy exchange in locomotion – valuable or inevitable?.....	102
4.8	Momentum and energy in locomotion: Dynamic fundamentals	103
4.9	Energy – lost unless recovered, or available unless lost?	104
	References	105

Chapter 5 Concepts in Locomotion: Wheels, Spokes, Collisions and Insight from the Center of Mass 111

John E. A. Bertram

5.1	Introduction.....	111
5.2	Understanding brachiation: An analogy for terrestrial locomotion	112
5.3	Bipedal walking: Inverted pendulum or inverted “collision-limiting brachiator analog”?	117
5.4	Basic dynamics of the step-to-step transition in bipedal walking	120
5.5	Subtle dynamics of the step-to-step transition in bipedal walking and running	124
5.6	Pseudo-elastic motion and true elastic return in running gaits	130
5.7	Managing CoM motion in quadrupedal gaits	131
5.7.1	Walk.....	132
5.7.2	Trot	133
5.7.3	Gallop.....	133
5.8	Conclusion	138
	References	139

Chapter 6 Reductionist Models of Walking and Running 143

James R. Usherwood

6.1 Part 1: Bipedal locomotion and “the ultimate cost of legged locomotion?”	143
6.1.1 Introduction.....	143
6.1.2 Reductionist models of walking	144
6.1.3 The benefit of considering locomotion as inelastic	150
6.2 Part 2: quadrupedal locomotion	158
6.2.1 Introduction.....	158
6.2.2 Quadrupedal dynamic walking and collisions.....	158
6.2.3 Higher speed quadrupedal gaits	161
6.2.4 Further success of reductionist mechanics	162
Appendix A: Analytical approximation for costs of transport including legs and “guts and gonads” losses	166
6A.1 List of symbols.....	166
6A.2 Period definitions for a symmetrically running biped	166
6A.3 Ideal work for the leg.....	167
6A.4 Vertical work calculations for leg.....	168
6A.5 Horizontal work calculations for leg.....	169
6A.6 Hysteresis costs of “guts and gonads” deflections.....	169
6A.7 Cost of transport.....	170
References	170

Chapter 7 Whole-Body Mechanics: How Leg Compliance Shapes the Way We Move 173

Andre Seyfarth, Hartmut Geyer, Susanne Lipfert, J. Rummel, Yvonne Blum, M. Maus and D. Maykranz

7.1 Introduction	173
7.2 Jumping for distance – a goal-directed movement.....	175
7.3 Running for distance – what is the goal?.....	177
7.4 Cyclic stability in running.....	178
7.5 The wheel in the leg – how leg retraction enhances running stability.....	179
7.6 Walking with compliant legs.....	180
7.7 Adding an elastically coupled foot to the spring-mass model.....	184
7.8 The segmented leg – how does joint function translate into leg function?	185
7.9 Keeping the trunk upright during locomotion.....	187
7.10 The challenge of setting up more complex models	188
Notes	190
References	190

Chapter 8 The Most Important Feature of an Organism's Biology: Dimension, Similarity and Scale..... 193

John E. A. Bertram

8.1 Introduction.....	193
8.2 The most basic principle: Surface area to volume relations	194
8.3 Assessing scale effects.....	197
8.4 Physiology and scaling.....	198
8.5 The allometric equation: The power function of scaling	203
8.6 The standard scaling models.....	207
8.6.1 Geometric similarity.....	208
8.6.2 Static stress similarity.....	209
8.6.3 Elastic similarity	209
8.7 Differential scaling – where the limit may change.....	210
8.7.1 Assessing the assumptions	215
8.8 A fractal view of scaling.....	215
8.9 Making valid comparisons: Measurement, dimension and functional criteria	217
8.9.1 Considering units.....	217
8.9.2 Fundamental and derived units.....	219
8.9.3 Froude number: A dimensionless example.....	222
References	223

Chapter 9 Accounting for the Influence of Animal Size on Biomechanical Variables: Concepts and Considerations 229

Sharon Bullimore

9.1 Introduction.....	229
9.2 Commonly used approaches to accounting for size differences.....	230
9.2.1 Dividing by body mass.....	230
9.2.2 Dimensionless parameters.....	232
9.3 Empirical scaling relationships	237
9.4 Selected biomechanical parameters.....	238
9.4.1 Ground reaction force.....	238
9.4.2 Muscle force	239
9.4.3 Muscle velocity.....	242
9.4.4 Running speed	242
9.4.5 Jump height.....	244
9.4.6 Elastic energy storage	246
9.5 Conclusions.....	247
Acknowledgements.....	247
References	247

Chapter 10	Locomotion in Small Tetrapods: Size-Based Limitations to “Universal Rules” in Locomotion	251
	<i>Audrone R. Biknevicius, Stephen M. Reilly and Elvedin Kljuno</i>	
10.1	Introduction	251
10.2	Active mechanisms contributing to the high cost of transport in small tetrapods	254
10.3	Limited passive mechanisms for reducing cost of transport in small tetrapods	255
10.4	Gait transitions from vaulting to bouncing mechanics	257
10.5	The “unsteadiness” of most terrestrial locomotion	262
	Appendix – a model of non-steady speed walking	265
10A.1	Spring-mass inverted pendulum model of walking	265
10A.2	Recovery ratio calculation	269
	References	271
Chapter 11	Non-Steady Locomotion	277
	<i>Monica A. Daley</i>	
11.1	Introduction	277
11.1.1	Why study non-steady locomotion?	278
11.2	Approaches to studying non-steady locomotion	279
11.2.1	Simple mechanical models	280
11.2.2	Research approaches to non-steady locomotion	281
11.3	Themes from recent studies of non-steady locomotion	282
11.3.1	Limits to maximal acceleration	282
11.3.2	Morphological and behavioral factors in turning mechanics	283
11.4	The role of intrinsic mechanics for stability and robustness of locomotion	288
11.4.1	Some definitions	289
11.4.2	Measures of sensitivity and robustness	290
11.4.3	What do we learn about stability from simple models of running?	291
11.4.4	Limitations to stability analysis of simple models	295
11.4.5	The relationship between ground contact conditions and leg mechanics on uneven terrain	296
11.4.6	Compromises among economy, robustness and injury avoidance in uneven terrain	298
11.5	Proximal-distal inter-joint coordination in non-steady locomotion	299
	References	302

Chapter 12	The Evolution of Terrestrial Locomotion in Bats: The Bad, the Ugly, and the Good.....	307
	<i>Daniel K. Riskin, John E. A. Bertram and John W. Hermanson</i>	
12.1	Bats on the ground: Like fish out of water?	307
12.2	Species-level variation in walking ability	308
12.3	How does anatomy influence crawling ability?	309
12.4	Hindlimbs and the evolution of flight	311
12.5	Moving a bat's body on land: The kinematics of quadrupedal locomotion	315
12.6	Evolutionary pressures leading to capable terrestrial locomotion	318
12.7	Conclusions and future work	319
	Acknowledgements	320
	References	320
Chapter 13	The Fight or Flight Dichotomy: Functional Trade-Off in Specialization for Aggression Versus Locomotion	325
	<i>David R. Carrier</i>	
13.1	Introduction	325
13.1.1	Why fighting is important	327
13.1.2	Size sexual dimorphism as an indicator of male-male aggression	328
13.2	Trade-offs in specialization for aggression versus locomotion	329
13.2.1	The evolution of short legs – specialization for aggression?	329
13.2.2	Muscle architecture of limbs specialized for running versus fighting	331
13.2.3	Mechanical properties of limb bones that are specialized for running versus fighting	334
13.2.4	The function of foot posture: Aggression versus locomotor economy	334
13.3	Discussion	338
	References	341
Chapter 14	Design for Prodigious Size without Extreme Body Mass: Dwarf Elephants, Differential Scaling and Implications for Functional Adaptation	349
	<i>John E. A. Bertram</i>	
14.1	Introduction	349
14.2	Elephant form, mammalian scaling and dwarfing	351
14.2.1	Measurements	356
14.2.2	Observations	356
14.3	Interpretation	357
	Acknowledgements	364
	References	364

Chapter 15 Basic Mechanisms of Bipedal Locomotion: Head-Supported Loads and Strategies to Reduce the Cost of Walking.....	369
<i>James R. Usherwood and John E. A. Bertram</i>	
15.1 Introduction.....	369
15.2 Head-supported loads in human-mediated transport.....	370
15.2.1 Can the evidence be depended upon?	371
15.3 Potential energy saving advantages.....	373
15.4 A simple alternative model	376
15.5 Conclusions.....	382
References	382
Chapter 16 Would a Horse on the Moon Gallop? Directions Available in Locomotion Research (and How Not to Spend Too Much Time Exploring Blind Alleys).....	385
<i>John E. A. Bertram</i>	
16.1 Introduction.....	385
References	392
Index.....	393
