## PART I

### SUMMARY AND INTRODUCTION

|                                                                                              |    |
|----------------------------------------------------------------------------------------------|----|
| 1. Summary: A Bird's-Eye View of Community and Population Effects of Ontogenetic Development | 3  |
| Historical Background                                                                        | 3  |
| Biomass Overcompensation                                                                     | 7  |
| Ontogenetic (A)Symmetry in Energetics                                                        | 8  |
| Emergent Community Effects of Biomass Overcompensation                                       | 11 |
| Ontogenetic Niche Shifts in Consumer Life History                                            | 14 |
| Ontogenetic Niche Shifts in Predator Life History                                            | 15 |
| Competition between Consumers with and without Ontogenetic Niche Shifts                      | 17 |
| Ontogenetic (A)Symmetry in Energetics and Population Dynamics                                | 19 |
| Generalization                                                                               | 22 |
| 2. Life History Processes, Ontogenetic Development, and Density Dependence                   | 24 |
| Back to Darwin                                                                               | 24 |
| Individual- versus Population-Level Assumptions                                              | 28 |
| The Population Dynamical Triad                                                               | 32 |
| Growth Patterns and the Ecology of Ontogenetic Development                                   | 34 |
| Body-Size Scaling and Magnitude of Body-Size Changes                                         | 40 |
| Changes in Ecological Roles over Ontogeny                                                    | 44 |
| Stepping Back—Some Perspectives                                                              | 45 |

## PART II

### ONTOGENETIC DEVELOPMENT AND COMMUNITY STRUCTURE

|                                         |    |
|-----------------------------------------|----|
| 3. Biomass Overcompensation             | 49 |
| A Stage-Structured, Bioenergetics Model | 50 |

|                                                                                       |            |
|---------------------------------------------------------------------------------------|------------|
| Equal Ingestion Rates                                                                 | 64         |
| Unequal Ingestion Rates                                                               | 69         |
| Empirical Evidence                                                                    | 86         |
| Asymmetry and Life History Effects                                                    | 90         |
| More Complicated Life Histories                                                       | 93         |
| Ontogenetic Symmetry and Biomass Overcompensation                                     | 107        |
| <b>4. Emergent Allee Effects through Biomass Overcompensation</b>                     | <b>115</b> |
| Emergent Allee Effects in Stage-Structured Biomass Models                             | 116        |
| Emergent Allee Effects in the Kooijman-Metz Model                                     | 136        |
| Size-Structured Predators Foraging on Size-Structured Prey                            | 145        |
| Empirical Evidence for Emergent Allee Effects                                         | 159        |
| <b>5. Emergent Facilitation among Predators on Size-Structured Prey</b>               | <b>165</b> |
| Generalists Facilitating Specialist Predators                                         | 169        |
| Facilitation between Specialist Predators                                             | 175        |
| Multiple Predators and a Single Prey                                                  | 186        |
| Experimental Evidence                                                                 | 188        |
| <b>6. Ontogenetic Niche Shifts</b>                                                    | <b>196</b> |
| Consumer-Resource Systems                                                             | 198        |
| Consequences for Higher Trophic Levels                                                | 209        |
| Ontogenetic Niche Shifts in Predator Life History                                     | 226        |
| <b>7. Mixed Interactions</b>                                                          | <b>253</b> |
| Niche Overlap between Stage-Structured Prey and Predators                             | 256        |
| Niche Overlap between Size-Structured Prey and Predators                              | 281        |
| Empirical Studies                                                                     | 292        |
| <b>8. Ontogenetic Niche Shifts, Predators, and Coexistence among Consumer Species</b> | <b>296</b> |
| Ontogenetic Niche Shifts and Interspecific Competition                                | 297        |
| Ontogenetic Niche Shifts in Both Consumers                                            | 311        |
| Effects of Predators on Coexistence of Consumers                                      | 317        |

## PART III

## ONTOGENETIC DEVELOPMENT AND COMMUNITY DYNAMICS

|                                                 |            |
|-------------------------------------------------|------------|
| <b>9. Dynamics of Consumer-Resource Systems</b> | <b>329</b> |
| A Size-Structured Population Model              | 330        |

|                                                                                                                                                |     |
|------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Other Size-Dependent Consumer-Resource Dynamics                                                                                                | 354 |
| <i>Daphnia</i> -Algae as a Model System for the Study of Stage-Structured Dynamics                                                             | 357 |
| 10. Dynamics of Consumer-Resource Systems with Discrete Reproduction: Multiple Resources and Confronting Model Predictions with Empirical Data | 361 |
| Overall Model Characteristics                                                                                                                  | 362 |
| Derivation of Individual-Level Model                                                                                                           | 363 |
| The Model at the Population Level                                                                                                              | 369 |
| Critical Resource Density and Cohort Dynamics                                                                                                  | 373 |
| Multiple Resources and Ontogenetic Niche Shifts                                                                                                | 378 |
| Model Predictions and Empirical Data                                                                                                           | 384 |
| 11. Cannibalism in Size-Structured Systems                                                                                                     | 391 |
| Background Overview                                                                                                                            | 392 |
| A Discrete-Continuous Model for Cannibalism                                                                                                    | 396 |
| Effects of Harvesting Cannibalistic Populations                                                                                                | 412 |
| Giant Individuals: Theory and Observation                                                                                                      | 416 |

## PART IV

## EXTENSIONS AND PERSPECTIVES

|                                                                         |     |
|-------------------------------------------------------------------------|-----|
| 12. Demand-Driven Systems, Model Hierarchies, and Ontogenetic Asymmetry | 425 |
| Demand-Driven Systems                                                   | 426 |
