Detailed Contents

Chapter 1 The "Brain of the Cell": Data Processing by Protein Networks 1

- 1.1 Metaphors and reductionism: temptations and limitations 1
- 1.2 Information and signals 3
- 1.3 Proteins are binary switches 7
- 1.4 Signal-transducing proteins are "nanoneurons" 9
- 1.5 Proteins form logical gates and "neural networks" 10
- 1.6 Privacy versus publicity 11
- 1.7 Cross talking and network formation 14
- 1.8 Interaction domains: how the network is plugged together 17
- 1.9 Generation of signaling patterns 22

Chapter 2 Supplying the Network with Energy: Basic Biochemistry of Signal Transduction 27

- 2.1 No order without work 27
- 2.2 Redox and nitrosylation switches: a balance on a narrow ridge 30
- 2.3 Switches operated by enzymes that hydrolyze energy-rich compounds 34
- 2.4 GTPase or G-protein switch 36
- 2.5 ATPase switches 40
- 2.6 Protein phosphorylation 47
- 2.7 Protein acetylation and methylation: tools of gene regulation and more 58
- 2.8 Protein ubiquitylation: more than a signal of protein degradation 61
- 2.9 Mono- and poly(ADP-ribosylation) 69
- 2.10 Ion channel switches: how to make use of electrical charge 71
- 2.11 Proteolysis switch: protein degradation provides messenger molecules and energy 77
- 2.12 Receptors: how energy-supplying reactions are combined with signal transduction 78
- 2.13 Brief summary of experimental standard methods for investigation of signaling pathways 81
- 2.14 Model organisms for investigation of cellular signal processing 83

Chapter 3 Evolution of Cellular Data Processing 87

- 3.1 Evolution of biological signal processing 87
- 3.2 The RNA world 90

- 3.3 Signal-controlled membrane transport: the ancient way to communicate 94
- 3.4 Sensor-dependent signal processing: two-component systems 101
- 3.5 From vagabonds to societies: "bacterial hormones" 121
- 3.6 From bacteria to humans: evolution of signaling mechanisms 126

Chapter 4 Basic Equipment: G-Proteins, Second Messengers, and Protein Kinases 141

- 4.1 Life is stress 141
- 4.2 Discovery of intracellular signal transduction 145
- 4.3 Trimeric G-proteins: coupling of receptors with the protein network 147
- 4.4 Downstream of G-proteins: enzymes producing second messengers 153
- 4.5 Guanylate cyclases are not controlled by trimeric G-proteins 176
- 4.6 The next level: protein kinases as sensors of second messengers 178

Chapter 5 Signal Transduction by Receptors with Seven Transmembrane Domains 191

- 5.1 An evolutionary model of success 191
- 5.2 G-protein-coupled receptors: structure and mode of operation 193
- 5.3 Adrenergic receptors: sensors of stress and sympathetic signals 202
- 5.4 Muscarinic acetylcholine receptors are sensors of parasympathetic signals 209
- 5.5 Stress and the heart: the competition between sympathetic and parasympathetic signals 210
- 5.6 Protease-activated receptors are major players in blood clotting and inflammation 212
- 5.7 Adaptation of G-protein-controlled signaling: a matter of feedback 214
- 5.8 Arrestins are multifunctional adaptors for signaling cross talk 216
- 5.9 Heptahelical receptors in hedgehog and Wnt signaling pathways 220
- 5.10 Other G-protein-independent heptahelical receptors: lessons from slime molds and Homer 225

Chapter 6 Signal Transduction by Serine/Threonine Kinase-Coupled Receptors

6.1	The principle of oligomerization-driven signal transduction	229
6.2	Ser/Thr-kinases as receptors: transforming growth factor β receptor family	231
6.3	Cytokine receptors: key players in defense reactions	234

Chapter 7 Signal Transduction by Tyrosine Kinase- and Protein Phosphatase-Coupled Receptors

7.1	Receptor tyrosine kinases	249
7.2	Receptors associated with tyrosine kinases	268
7.3	Signal transduction by cell adhesion molecules	280
7.4	Protein tyrosine phosphatases and phosphatase-coupled receptors	284

Chapter 8 Eukaryotic Gene Transcription: The Ultimate Target of Signal Transduction

8.1	Initiation of eukaryotic transcription	292
8.2	Histones, nucleosomes, and chromatin	296
8.3	Transcription factors as hormone receptors	306
8.4	Ligand-controlled transcription factors are xenosensors of the toxic stress response	315
8.5	Chaperones and peptidyl-prolyl isomerases prepare signaling proteins for work	318
8.6	Transcription factors as substrates of protein kinases	321
8.7	The hypoxic stress response	323

Chapter 9 Signals Controlling mRNA Translation

9.1	Eukaryotic mRNA translation: the essentials	329
9.2	Protein release by the endoplasmic reticulum is controlled by G-proteins	331
9.3	Signaling cascades controlling translation	333
9.4	Network for adjustment of cell growth to the supply situation	339
9.5	The signaling network of non-coding RNAs	355

Chapter 10 Signal Transduction by Small G-Proteins: The Art of Molecular Targeting

10.1	Ras proteins: generation of order in signal transduction	359
10.2	Other G-proteins of the Ras subfamily: an unfinished story	369
10.3	GTPases of the Rho family are master regulators of the actin cytoskeleton and more	369

10.4	Arf and Rab proteins control vesicle transport	383
10.5	Ran, nuclear transport, and mitosis	391

Chapter 11 Mitogen-activated Protein Kinase and Nuclear Factor κ B Modules

11.1	MAP kinase modules are universal relay stations of eukaryotic signal processing	395
11.2	MAP3 kinases are sensors of MAP kinase modules	400
11.3	MAP4 kinases and G-proteins: lessons learned from yeast	404
11.4	Organization of MAP kinase modules by scaffold proteins	406
11.5	Downstream of MAP kinase modules: MAP kinase-activated protein kinases	408
11.6	Downstream of MAP kinase modules: transcription factors	410
11.7	NF κ B signaling pathway	414

Chapter 12 Regulation of Cell Division

12.1	The cell cycle	423
12.2	Cyclins: cell cycle regulators and beyond	425
12.3	Cyclin-dependent protein kinases: dual control by phosphorylation and dephosphorylation	426
12.4	Cyclin-dependent kinase inhibitors: keeping the cell cycle under control	428
12.5	G0 cells, restriction points, and the effect of mitogenic signals	429
12.6	Retinoblastoma proteins: master regulators of the cell cycle	431
12.7	Regulation of G2 phase and G2-M transition: precise like clockwork	433
12.8	Genotoxic stress response: a matter of life and death	434
12.9	Phases of mitosis	439
12.10	Ubiquitin ligase APC/C: giving the beat of mitosis	441
12.11	Mitotic protein kinases: formation of the mitotic spindle	443
12.12	The spindle assembly checkpoint provides a last chance to correct mistakes	445
12.13	Cytokinesis: how a new cell is born	447
12.14	Mitotic exit: characterization in yeast	448

Chapter 13 Signal Transduction by Proteolysis, and Programmed Cell Death

13.1	Secretase-coupled receptors: generation of peptide second messengers	453
13.2	Signal-controlled suicide of cells	462
13.3	Cancer: a disease of signal processing	476

Chapter 14 Signal Transduction by Ions 485

14.1 Cation channels: prototypical structures and gating mechanisms	486
14.2 Voltage-gated Na^+ channels: masters of the action potential	489
14.3 The multi-talented Epithelial Na^+ channels	492
14.4 K^+ -selective ion channels are regulators of hyperpolarization and osmotic pressure	494
14.5 Calcium ions: the most versatile cellular signals	500
14.6 Downstream of Ca^{2+} signals	518
14.7 Anion channels	535

Chapter 15 Sensory Signal Processing 543

15.1 Taste	543
15.2 Mechanical stimuli: touch and sound	547
15.3 Temperature and pain	550
15.4 Smell	552
15.5 Vision	555
15.6 Sensory adaptation	559

Chapter 16 Signaling at Synapses: Neurotransmitters and their Receptors 563

16.1 Neurons and synapses	563
16.2 Acetylcholine receptors	572

16.3 γ -Aminobutyric acid and glycine receptors are the masters of inhibitory neurotransmission	576
16.4 Glutamate receptors are favorites of molecular brain research	580
16.5 Nitric oxide: a Janus-faced signal molecule	589
16.6 Receptors of purine and pyrimidine nucleotides: the ATP signal	593
16.7 Cannabinoid and vanilloid receptors	595
16.8 Opioid receptors	596
16.9 Narcotics and drug addiction	597

Chapter 17 Putting Together the Pieces: The Approach of Systems Biology 607

17.1 The whole is greater than the sum of its parts	607
17.2 Systems biology: origin and focus	607
17.3 System structure: basic network topologies and properties	608
17.4 The iterative cycle: laboratory experiments and mathematical model development	612
17.5 Problems of quantitative data generation and mathematical model development	613
17.6 Mathematical modeling of a signaling pathway	614
17.7 Synthetic and predictive biology: the improvement of biological systems	619
