Chapter 1

Defining Conservation Biology 3

The New Science of Conservation Biology 4

The philosophical roots of conservation biology 7

Conservation biology's international scope 9

The interdisciplinary approach: A case study with sea turtles 10

Conservation Biology's Ethical Principles 13

Achievements and Challenges 15

Summary 16

Chapter 2

What is Biodiversity? 19

Species Diversity 21

What is a species? 21

Measuring species diversity 24

Genetic Diversity 25

Ecosystem Diversity 27

Species interactions 28

Food chains and food webs 32

Keystone species and resources 32

Ecosystem dynamics 34

Biodiversity Worldwide 35

How many species exist? 35

Where is the world's biodiversity found? 38

The distribution of species 41

Summary 43

Chapter 3

The Value of Biodiversity 47

Ecological Economics and Environmental Economics 49

Direct Economic Values 52

Consumptive use value 53

Productive use value 54

Indirect Economic Values 56

Ecosystem productivity 57

Water and soil protection 59

Climate regulation 61

Species relationships and environmental monitors 61

Amenity value 63

Educational and scientific value 64

Multiple uses of a single resource: A case study 66

The Long-Term View: Option Value 66

Existence Value 69

Environmental Ethics 72

Ethical arguments supporting preservation 72

Deep ecology 75

Summary 76

Chapter 4

Threats to Biodiversity 79

Human Population Growth and Its Impact 80

Habitat Destruction 83

Threatened rain forests 85

Other threatened habitats 88

Habitat Fragmentation 92

Threats posed by fragmentation 94

Edge effects 95

Environmental Degradation and Pollution 98

Pesticide pollution 99

Water pollution 100

Air pollution 103

Global Climate Change 104

Warmer waters, acidification, and rising sea levels 108

The overall effect of global warming 109

Overexploitation 110

International wildlife trade 112

Commercial harvesting 114

Invasive Species 116

Invasive species on islands 119

Invasive species in aquatic habitats 120

The ability of species to become invasive 122

Control of invasive species 123

Genetically modified organisms 125

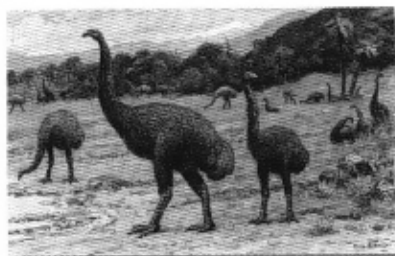

Disease 126

A Concluding Remark 129

Summary 130

Chapter 5

Extinction is Forever 135

The Meaning of "Extinct" 137

Rates of Extinction 138

Extinction rates in aquatic environments 141

Extinction rates on islands 141

Island biogeography and extinction rate predictions 142

Local extinctions 144

Vulnerability to Extinction 146

Problems of Small Populations 150

Minimum viable population (MVP) 150

Loss of genetic variation 153

Effective population size 158

Demographic and environmental stochasticity 161

The extinction vortex 165

Summary 166

Chapter 6

Conserving Populations and Species 16

Applied Population Biology 170

Methods for studying populations 171

Monitoring populations 172

Population viability analysis 176

Metapopulations 178

Conservation Categories 180

Legal Protection of Species 184

National laws 184

The U.S. Endangered Species Act 185

International agreements 188

Establishing New Populations 191

Considerations for animal programs 193

New plant populations 196

The status of new populations 198

Ex Situ Conservation Strategies 199

Zoos 200

Aquariums 205

Botanical gardens 206

Seed banks 208

Summary 210

Chapter 7

Protected Areas 213

Establishment and Classification of Protected Areas 214

Marine protected areas 217

The effectiveness of protected areas 217

Prioritization: What should be protected? 219

Measuring effectiveness: Gap analysis 226

Designing Protected Areas 229

Protected area size and characteristics 230

Networks of protected areas 234

Landscape Ecology 238

Managing Protected Areas 239

Managing sites 242

Monitoring sites 244

Management and people 246

Zoning as a solution to conflicting demands 246

Challenges to Park Management 249

Summary 250

Chapter 8

Conservation Outside Protected Areas 255

Unprotected Public and Private Lands 256

Human-dominated landscapes 257

Ecosystem Management 260

Working with Local People 263

In situ agricultural conservation 266

Extractive reserves 266

Community-based initiatives 267

Payments for ecosystem services 268

Evaluating conservation initiatives 269

Restoring Damaged Ecosystems 270

Approaches to ecosystem restoration 274

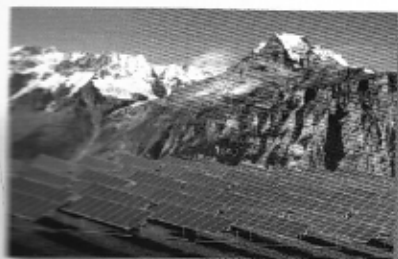

Targets of major restoration efforts 275

The future of restoration ecology 278

Summary 280

Chapter 9

The Challenge of Sustainable Development 283

Sustainable Development at the Local Level 285

Local and regional conservation regulations 286

Land trusts 286

Enforcement and public benefits 289

Conservation at the National Level 290

International Approaches to Sustainable Development 292

International conservation agreements 293

International summits 296

Funding for Conservation 297

The World Bank and international NGOs 298

Environmental trust funds 300

Debt-for-nature swaps 300

How effective is conservation funding? 301

Conservation Education 303

The Role of Conservation Biologists 305

Summary 308

Appendix: Selected Environmental Organizations and Sources of Information 311

Glossary 315
