

Contents

	Preface	Page ix
1	Life from a physics perspective	1
1.1	Life copies from itself and from other life	1
1.2	Biology is the result of a very long historical process	2
1.3	Self-assembly and the genetic code	3
1.4	Biological molecules have long backbones	6
1.5	Computation	6
1.6	Information gathering and communication	7
1.7	Feedback	7
1.8	Push-pull	8
1.9a	Life is modular	9
1.9b	Life is not modular	9
1.10	Stochastic processes play an important role in life	9
1.11	Life harvests energy and converts it to cyclic motion	10
1.12	Biological physics is " $k_B T$ physics"	13
2	<i>E. coli</i> as a model system	17
2.1	DNA, RNA and proteins	17
2.2	The <i>E. coli</i> cell	22
2.3	Transcription and translation numbers	24
2.4	<i>E. coli</i> content varies with its growth rate	32
2.5	Summary	35
3	Dynamics of regulatory links	36
3.1	Regulating a piece of DNA	36
3.2	Transcription regulation	41
3.3	Post-transcriptional regulation	44
3.4	Summary	48
4	Statistical mechanics of phage λ	49
4.1	Lifecycle of λ phage	49
4.2	Bacterial growth and counting	56

4.3	Chemical binding and counting	59
4.4	Chemistry and co-operativity as statistical mechanics	62
4.5	Distant DNA in gene regulation	68
4.6	Summary	78
5	Diffusion and randomness in transcription	79
5.1	Random walks and diffusion	79
5.2	Timescales for target location in a cell	83
5.3	Traffic on DNA	89
5.4	Bursty transcription initiation	94
5.5	Economy of operons: noise minimization	100
5.6	Summary	102
6	Stochastic genes and persistent decisions	104
6.1	Stochastic simulations	104
6.2	Maintenance of lysogeny in the λ system	109
6.3	The phage λ circuit beyond CI and Cro	117
6.4	Summary	122
7	<i>cis</i>-Acting gene regulation and epigenetics	123
7.1	Nucleosomes and their enzymes	123
7.2	Nucleosome-mediated epigenetics	127
7.3	A regulated two-state model	135
7.4	Coupled epigenetics in olfactory differentiation	142
7.5	Other models for <i>cis</i> -mediated gene regulation	146
7.6	Summary	149
8	Feedback circuits	150
8.1	Small regulatory subnetworks	150
8.2	Negative feedback	151
8.3	Positive feedback	159
8.4	Combining feedback in small-molecule regulation	161
8.5	Combined feedback loops and spatial organization	167
8.6	Summary	176
9	Networks	177
9.1	Convergent computation	177
9.2	Connectedness	178
9.3	Large-scale molecular networks	190
9.4	Analysis of network topologies	193
9.5	Models for scale-free molecular networks	198
9.6	Summary	204

10	Signaling and metabolic networks	205
10.1	Signaling across networks	205
10.2	Enzyme kinetics and phosphorylation	212
10.3	Adaptation	216
10.4	Metabolic fluxes	219
10.5	Summary	225
11	Agent-based models of signaling and selection	226
11.1	Excitable agents as cells in a tissue	226
11.2	Information spreading on social scales	227
11.3	Tragedy of the commons	235
11.4	Summary	241
12	Competition and diversity	242
12.1	Phage worlds	242
12.2	Phage–bacteria ecology	252
12.3	Phage games: lysogeny or lysis	265
12.4	Speciation and biodiversity of sessile species	272
12.5	Summary	277
13	Evolution and extinction	279
13.1	History	279
13.2	Fitness landscapes	282
13.3	Punctuated equilibrium and co-evolution	286
13.4	Summary	295
	Appendix	296
	Langevin versus Fokker–Planck equation	296
	Kramers' equation	297
	First passage for random walks	299
	References	301
	Index	334
