Preface	viii
About the Companion Website	x
1 Significance, History, and Challenges of Environmental Microbiology	1
1.1 Core concepts can unify environmental microbiology	1
1.2 Synopsis of the significance of environmental microbiology	2
1.3 A brief history of environmental microbiology	6
1.4 Complexity of our world	10
1.5 Many disciplines and their integration	13
2 Formation of the Biosphere: Key Biogeochemical and Evolutionary Events	25
2.1 Issues and methods in Earth's history and evolution	26
2.2 Formation of early planet Earth	26
2.3 Did life reach Earth from Mars?	30
2.4 Plausible stages in the development of early life	31
2.5 Mineral surfaces in marine hydrothermal vents: the early iron/sulfur world could have driven biosynthesis	35
2.6 Encapsulation (a key to cellular life) and an alternative (nonmarine) hypothesis for the habitat of precellular life	36
2.7 A plausible definition of the tree of life's "Last universal common ancestor" (LUCA)	37
2.8 The rise of oxygen	39
2.9 Evidence for oxygen and cellular life in the sedimentary record	39
2.10 The evolution of oxygenic photosynthesis	42
2.11 Consequences of oxygenic photosynthesis: molecular oxygen in the atmosphere and large pools of organic carbon	45
2.12 Eukaryotic evolution: endosymbiotic theory and the blending of traits from <i>Archaea</i> and <i>Bacteria</i>	48
3 Physiological Ecology: Resource Exploitation by Microorganisms	56
3.1 The cause of physiological diversity: diverse habitats provide selective pressures over evolutionary time	57
3.2 Biological and evolutionary insights from genomics	57
3.3 Fundamentals of nutrition: carbon- and energy-source utilization provide a foundation for physiological ecology	69

3.4	Selective pressures: ecosystem nutrient fluxes regulate the physiological status and composition of microbial communities	71
3.5	Cellular responses to starvation: resting stages, environmental sensing circuits, gene regulation, dormancy, and slow growth	76
3.6	A planet of complex mixtures in chemical disequilibrium	86
3.7	A thermodynamic hierarchy describing biosphere selective pressures, energy sources, and biogeochemical reactions	91
3.8	Using the thermodynamic hierarchy of half reactions to predict biogeochemical reactions in time and space	93
3.9	Overview of metabolism and the "logic of electron transport"	104
3.10	The flow of carbon and electrons in anaerobic food chains: syntrophy is the rule	105
3.11	The diversity of lithotrophic reactions	109
4	A Survey of the Earth's Microbial Habitats	117
4.1	Terrestrial biomes	118
4.2	Soils: geographic features relevant to both vegetation and microorganisms	120
4.3	Aquatic habitats	124
4.4	Subsurface habitats: oceanic and terrestrial	131
4.5	Defining the prokaryotic biosphere: where do prokaryotes occur on Earth?	141
4.6	Life at the micron scale: an excursion into the microhabitat of soil microorganisms	145
4.7	Extreme habitats for life and microbiological adaptations	151
5	Microbial Diversity: Who is Here and How do we Know?	162
5.1	Defining cultured and uncultured microorganisms	163
5.2	Approaching a census: an introduction to the environmental microbiological "toolbox"	167
5.3	Criteria for census taking: recognition of distinctive microorganisms (species)	170
5.4	Proceeding toward census taking and measures of microbial diversity	175
5.5	The tree of life: our view of evolution's blueprint for biological diversity	181
5.6	A Sampling of key traits of cultured microorganisms from the domains <i>Eukarya</i> , <i>Bacteria</i> , and <i>Archaea</i>	185
5.7	Placing the "uncultured majority" on the tree of life: what have nonculture-based investigations revealed?	205
5.8	Viruses: an overview of biology, ecology, and diversity	213
5.9	Microbial diversity illustrated by genomics, horizontal gene transfer, and cell size	220
5.10	Biogeography of microorganisms	224
6	Generating and Interpreting Information in Environmental Microbiology: Methods and Their Limitations	238
6.1	How do we know?	239
6.2	Perspectives from a century of scholars and enrichment-cultivation procedures	239
6.3	Constraints on knowledge imposed by ecosystem complexity	243
6.4	Environmental microbiology's "Heisenberg uncertainty principle": model systems and their risks	245
6.5	Fieldwork: being sure sampling procedures are compatible with analyses and goals	247

6.6	Blending and balancing disciplines from field geochemistry to pure cultures	253
6.7	Overview of methods for determining the position and composition of microbial communities	257
6.8	Methods for determining in situ biogeochemical activities and when they occur	276
6.9	Cloning-based Metagenomics and related methods: procedures and insights	280
6.10	Cloning-free, next-generation sequencing and omics methods: procedures and insights	290
6.11	Discovering the organisms responsible for particular ecological processes: linking identity with activity	325
7	Microbial Biogeochemistry: A Grand Synthesis	356
7.1	Mineral connections: the roles of inorganic elements in life processes	357
7.2	Greenhouse gases and lessons from biogeochemical modeling	361
7.3	The "stuff of life": identifying the pools of biosphere materials whose microbiological transformations drive the biogeochemical cycles	372
7.4	Elemental biogeochemical cycles: concepts and physiological processes	393
7.5	Cellular mechanisms of microbial biogeochemical pathways	409
7.6	Mass balance approaches to elemental cycles	418
8	Special and Applied Topics in Environmental Microbiology	432
8.1	Other organisms as microbial habitats: ecological relationships	432
8.2	Microbial residents of plants and humans	449
8.3	Biodegradation and bioremediation	461
8.4	Biofilms	489
8.5	Evolution of catabolic pathways for organic contaminants	493
8.6	Environmental biotechnology: overview and nine case studies	499
8.7	Antibiotic resistance	514
9	Future Frontiers in Environmental Microbiology	538
9.1	The influence of systems biology on environmental microbiology	538
9.2	Ecological niches and their genetic basis	546
9.3	Concepts help define future progress in environmental microbiology	551
	Glossary	557
	Index	564
