

CONTENTS

List of Contributors	xv
Preface	xix
Acknowledgements	xxiii
1 Introduction: Mysteries, Molecules and Mechanisms	1
<i>John A. Bryant</i>	
1.1 Darwin and Margulis revisited	1
1.2 Nuclei – general features	3
1.3 The plant nuclear genome	5
1.3.1 General features	5
1.3.2 Replication of the nuclear genome	6
1.4 DNA inside, ribosomes outside	9
1.5 Concluding comments on the evolution of the nucleus	11
References	13
2 The Nuclear Envelope – Structure and Protein Interactions	19
<i>Katja Graumann and David E. Evans</i>	
2.1 Introduction	19
2.2 Organization and structure of the plant nuclear envelope	20
2.3 Proteins of the plant nuclear envelope	21
2.3.1 Proteins involved in signalling	22
2.3.2 Proteins of the nuclear pore complex	22
2.3.3 Proteins of the INM	23
2.3.4 Proteins spanning the periplasm and linking the NE membranes	25
2.3.5 The plant lamina	28
2.4 The plant nuclear envelope and the nucleoskeleton; attachments at the INM	31
2.5 The plant nuclear envelope and the cytoskeleton; attachments at the ONM	35
2.6 Targeting of proteins to the plant NE	36
2.7 Nuclear envelope protein dynamics in mitosis	38
2.7.1 The role of NPC in regulating NE dynamics in cell division	38
2.7.2 NE protein dynamics in division	40
2.8 The phragmoplast and cell plate and their relationship to the NE	41

2.9	The plant NE in meiosis	42
2.10	Lipid composition of the plant NE and its homeostasis	43
2.10.1	Nuclear-vacuolar junctions and lipid homeostasis	43
2.10.2	NE phospholipid regulation by lipins	44
2.11	The role of plant NE components in stress responses	45
2.11.1	Nuclei repositioning in response to environmental stimuli	45
2.11.2	Functions of the plant NE during viral infection	47
2.12	Concluding remarks	48
	References	48
3	The Plant Nuclear Pore Complex – The Nucleocytoplasmic Barrier and Beyond	57
	<i>Xiao Zhou, Joanna Boruc and Iris Meier</i>	
3.1	Nuclear pore complex structure	57
3.1.1	Structure of the NPC	58
3.1.2	Molecular composition of the NPC	59
3.1.3	Nucleocytoplasmic trafficking	62
3.2	Physiological and developmental roles of plant nuclear pore components	67
3.2.1	Plant-microbe interactions	67
3.2.2	Hormone responses	72
3.2.3	Abiotic stress responses	73
3.2.4	Growth and development	74
3.3	The Dynamics of the Nuclear Pore Complex	75
3.3.1	Types of mitosis	75
3.3.2	NPC disassembly and dynamics of animal NPC components	76
3.3.3	Dynamics of fungal NPC components	78
3.3.4	Dynamics of plant NPC components	79
3.4	Conclusions	81
	References	81
4	Nucleoskeleton in Plants: The Functional Organization of Filaments in the Nucleus	93
	<i>Martin W. Goldberg</i>	
4.1	Introduction	94
4.2	Intermediate filaments and the nucleoskeleton	96
4.3	Plants do not have intermediate filaments but they may have functional equivalents	99
4.4	Plants can evolve different solutions to the same problem	100
4.5	Intermediate filaments first evolved in the nucleus	101
4.6	Plants require a rigid nuclear boundary	101

4.7	Is there a trans-nuclear envelope complex in plants that links the nucleoskeleton to the cytoskeleton?	102
4.8	Role of the nuclear lamina as part of the nucleoskeleton	102
4.9	Structural evidence for the nucleoskeleton	104
4.10	NuMA in plants	107
4.11	Matrix attachment regions (MARs) and the role of the nucleoskeleton in chromatin organization	108
4.12	Chromocentres and the plant nucleoskeleton	109
4.13	Long coiled-coil proteins in plants and their role in nuclear organization: candidates for plamins and nucleoskeletal proteins?	109
4.14	Actin and microtubules in the nucleus	112
4.15	Conclusions	113
	Acknowledgements	113
	References	114
5	Genomics and Chromatin Packaging	123
	<i>Eugenio Sanchez-Moran</i>	
5.1	Chromatin components and structure in higher eukaryotes	123
5.2	Histones and nucleosome fibre	126
5.2.1	Histone variants	131
5.2.2	Histone modifications	136
5.2.3	Nucleosome dynamics	137
5.3	Linker histone and the higher order chromatin-order fibre	138
5.3.1	The elusive higher order chromatin fibre	140
5.4	Chromatin loops and chromosome axis	141
5.5	Conclusions and future prospects	145
	References	145
6	Heterochromatin Positioning and Nuclear Architecture	157
	<i>Emmanuel Vanrobays, Mélanie Thomas and Christophe Tatout</i>	
6.1	Heterochromatin structure	158
6.1.1	Heterochromatic sequences	158
6.1.2	Epigenetic marks	161
6.1.3	Non-histone protein binding	164
6.1.4	Heterochromatin is an epigenetic state	165
6.2	Heterochromatin organization	166
6.2.1	Heterochromatin and nuclear architecture	166
6.2.2	Recruitment of heterochromatin at the nuclear periphery	171
6.2.3	Higher order of chromatin organization	173
6.3	Functional significance of heterochromatin positioning	176
6.3.1	Centric heterochromatin directs chromosome segregation	176

6.3.2	Spatial positioning of heterochromatin affects transcriptional activity	178
6.3.3	Heterochromatin positioning protects against genome instability	179
6.4	Perspectives	180
	Acknowledgements	184
	References	184
7	Telomeres in Plant Meiosis: Their Structure, Dynamics and Function	191
	Nicola Y. Roberts, Kim Osman, F. Chris H. Franklin, Monica Pradillo, Javier Varas, Juan L. Santos and Susan J. Armstrong	
7.1	Introduction	192
7.1.1	The meiotic pathway	192
7.1.2	<i>Arabidopsis thaliana</i> as a model for meiosis	193
7.2	The telomeres and associated proteins	194
7.2.1	Telomere binding proteins	196
7.2.2	<i>Arabidopsis</i> telomere binding proteins	197
7.2.3	DNA repair proteins	201
7.3	The behaviour of the telomeres in meiosis	203
7.3.1	The bouquet	203
7.3.2	A role for the bouquet	204
7.4	Telomere dynamics in <i>Arabidopsis thaliana</i> meiosis	206
7.4.1	Meiosis in <i>A. thaliana</i> telomere-deficient lines	206
7.5	How are the telomeres moved in meiotic prophase I?	208
7.5.1	Colchicine disrupts meiotic progression	208
7.5.2	The role of actin in telomere movement	210
7.6	Components of the nuclear envelope	213
7.7	Components of the plant nuclear envelope	216
7.8	Conclusions and future prospects	217
	Acknowledgements	218
	References	218
8	The Nuclear Pore Complex in Symbiosis and Pathogen Defence	229
	Andreas Binder and Martin Parniske	
8.1	Introduction	229
8.2	The nuclear pore and plant-microbe symbiosis	230
8.2.1	Common signalling in arbuscular mycorrhiza and root-nodule symbiosis	230
8.2.2	Symbiotic signalling at the nucleus	231
8.2.3	Symbiotic defects in <i>ljpup85</i> , <i>ljpup133</i> and <i>nena</i> mutants	232

8.2.4	How do nucleoporins function in plant-microbe symbiosis?	233
8.3	The nuclear pore and plant defence	235
8.3.1	Plant immune responses can be triggered by pathogen-associated molecular patterns and microbial effectors	235
8.3.2	AtNUP88 and AtNUP96 are required for basal and NB-LRR-mediated plant immunity	236
8.3.3	Mechanisms of nucleoporin-mediated plant defence signalling	237
8.4	Specificity, redundancy and general functions of plant nucleoporins	239
8.4.1	The NUP107-160 sub-complex	239
8.4.2	Hormone signalling	242
8.4.3	Development, flowering time, stress tolerance and RNA transport	243
8.5	Challenges and conclusion	245
	References	246
