1 INTRODUCTION TO LANDSCAPE GENETICS – CONCEPTS, METHODS, APPLICATIONS, 1

Niko Balkenhol, Samuel A. Cushman, Andrew Storfer, and Lisette P. Waits

- 1.1 Introduction, 1
- 1.2 Defining landscape genetics, 2
- 1.3 The three analytical steps of landscape genetics, 3
- 1.4 The interdisciplinary challenge of landscape genetics, 3
- 1.5 Structure of this book – concepts, methods, applications, 5

References, 6

PART 1: CONCEPTS

2 BASICS OF LANDSCAPE ECOLOGY: AN INTRODUCTION TO LANDSCAPES AND POPULATION PROCESSES FOR LANDSCAPE GENETICISTS, 11

Samuel A. Cushman, Brad H. McRae, and Kevin McGarigal

- 2.1 Introduction, 11
- 2.2 How landscapes affect population genetic processes, 12
- 2.3 Defining the landscape for landscape genetic research, 16
- 2.4 Defining populations and characterizing dispersal processes, 21
- 2.5 Putting it together: combinations of landscape and population models, 24

- 2.6 Frameworks for delineating landscapes and populations for landscape genetics, 26

- 2.7 Current challenges and future opportunities, 30

References, 30

3 BASICS OF POPULATION GENETICS: QUANTIFYING NEUTRAL AND ADAPTIVE GENETIC VARIATION FOR LANDSCAPE GENETIC STUDIES, 35

Lisette P. Waits and Andrew Storfer

- 3.1 Introduction, 35
 - 3.2 Overview of landscape influences on genetic variation, 36
 - 3.3 Overview of DNA types and molecular methods, 38
 - 3.4 Important population genetic models, 41
 - 3.5 Measuring genetic diversity, 45
 - 3.6 Evaluating genetic structure and detecting barriers, 46
 - 3.7 Estimating gene flow using indirect and direct methods, 50
 - 3.8 Conclusion and future directions, 52
- References, 53

4 BASICS OF STUDY DESIGN: SAMPLING LANDSCAPE HETEROGENEITY AND GENETIC VARIATION FOR LANDSCAPE GENETIC STUDIES, 58

Niko Balkenhol and Marie-Josée Fortin

- 4.1 Introduction, 58
- 4.2 Study design terminology used in this chapter, 59
- 4.3 General study design considerations, 60
- 4.4 Considerations for landscape genetic study design, 61
- 4.5 Current knowledge about study design effects in landscape genetics, 66

- 4.6 Recommendations for optimal sampling strategies in landscape genetics, 71
- 4.7 Conclusions and future directions, 73
- References, 74

5 BASICS OF SPATIAL DATA ANALYSIS: LINKING LANDSCAPE AND GENETIC DATA FOR LANDSCAPE GENETIC STUDIES, 77

Helene H. Wagner and Marie-Josée Fortin

- 5.1 Introduction, 77
- 5.2 How to model landscape effects on genetic variation, 84
- 5.3 How to model isolation-by-distance, 93
- 5.4 Future directions, 95
- Acknowledgments, 96
- References, 96

PART 2: METHODS

6 SIMULATION MODELING IN LANDSCAPE GENETICS, 101

Erin Landguth, Samuel A. Cushman, and Niko Balkenhol

- 6.1 Introduction, 101
- 6.2 A brief overview of models and simulations, 101
- 6.3 General benefits of simulation modeling, 102
- 6.4 Landscape genetic simulation modeling, 103
- 6.5 Examples of simulation modeling in landscape genetics, 104
- 6.6 Designing and choosing landscape genetic simulation models, 108
- 6.7 The future of landscape genetic simulation modeling, 111

References, 111

7 CLUSTERING AND ASSIGNMENT METHODS IN LANDSCAPE GENETICS, 114

Olivier François and Lisette P. Waits

- 7.1 Introduction, 114
- 7.2 Exploratory data analysis and model-based clustering for population structure analysis, 115
- 7.3 Spatially explicit methods in landscape genetics, 119

- 7.4 Spatial EDA methods: spatial PCA and spatial factor analysis, 119
- 7.5 Spatial MBC methods, 120
- 7.6 Habitat and environmental heterogeneity models, 121
- 7.7 Discussion, 123
- References, 125

8 RESISTANCE SURFACE MODELING IN LANDSCAPE GENETICS, 129

Stephen F. Spear, Samuel A. Cushman, and Brad H. McRae

- 8.1 Introduction, 129
- 8.2 Techniques for parameterizing resistance surfaces, 133
- 8.3 Estimating connectivity from resistance surfaces, 137
- 8.4 Statistical validation of resistance surfaces, 139
- 8.5 The future of the resistance surface in landscape genetics, 142
- 8.6 Conclusions, 144
- References, 144

9 GENOMIC APPROACHES IN LANDSCAPE GENETICS, 149

Andrew Storfer, Michael F. Antolin, Stéphanie Manel, Bryan K. Epperson, and Kim T. Scribner

- 9.1 Introduction, 149
- 9.2 Current landscape genomics methods, 150
- 9.3 General challenges in landscape genomics, 157
- 9.4 Spatial autocorrelation, 157
- 9.5 Applications of landscape genomics to climate change, 159

References, 160

10 GRAPH THEORY AND NETWORK MODELS IN LANDSCAPE GENETICS, 165

Melanie Murphy, Rodney Dyer, and Samuel A. Cushman

- 10.1 Introduction, 165
- 10.2 Background on graph theory, 167
- 10.3 Landscape genetic applications, 170
- 10.4 Recommendations for using graph approaches in landscape genetics, 175
- 10.5 Current research needs, 176
- 10.6 Conclusion – potential for application of graphs for conservation, 176

References, 177

PART 3: APPLICATIONS**11 LANDSCAPES AND PLANT POPULATION GENETICS, 183***Radney J. Dyer*

- 11.1 Introduction, 183
- 11.2 Contemporary population genetic processes, 186
- 11.3 Historical population genetic processes, 190
- 11.4 Future research, 192
- References, 194

12 APPLICATIONS OF LANDSCAPE GENETICS TO CONNECTIVITY RESEARCH IN TERRESTRIAL ANIMALS, 199*Lisette P. Waits, Samuel A. Cushman, and Steve F. Spear*

- 12.1 Introduction, 199
- 12.2 General overview of terrestrial animal study systems and research challenges, 199
- 12.3 Detecting barriers and defining corridors, 202
- 12.4 Evaluating population dynamics, 205
- 12.5 Detecting and predicting the response to landscape change, 206
- 12.6 Common limitations of landscape genetic studies involving terrestrial animals, 208
- 12.7 Testing ecological hypotheses about gene flow in heterogeneous landscapes, 208
- 12.8 Knowledge gaps and future directions, 213
- References, 214

13 WATERSCAPE GENETICS - APPLICATIONS OF LANDSCAPE GENETICS TO RIVERS, LAKES, AND SEAS, 220*Kimberly A. Selkoe, Kim T. Scribner, and**Heather M. Galindo*

- 13.1 Introduction, 220
- 13.2 Understanding marine and freshwater environments, 223
- 13.3 Typical research questions and approaches, 229
- 13.4 Applications of landscape genetic approaches, 234

- 13.5 Future directions: knowledge gaps, research challenges, and limitations, 237

Acknowledgments, 238

References, 238

14 CURRENT STATUS, FUTURE OPPORTUNITIES, AND REMAINING CHALLENGES IN LANDSCAPE GENETICS, 247*Niko Balkenhol, Samuel A. Cushman, Lisette P. Waits, and Andrew Storfer*

- 14.1 Introduction, 247
- 14.2 Conclusion 1: issues of scale need to be considered, 248
- 14.3 Conclusion 2: sampling needs to specifically target landscape genetic questions, 248
- 14.4 Conclusion 3: choice of appropriate statistical methods remains challenging, 249
- 14.5 Conclusion 4: simulations play a key role in landscape genetics, 249
- 14.6 Conclusion 5: measures of genetic variation are rarely developed specifically for landscape genetics, 249
- 14.7 Conclusion 6: landscape resistance is just one of the possible landscape-genetic relationships, 250
- 14.8 Conclusion 7: genomics provides novel opportunities, but also creates new challenges, 250
- 14.9 Conclusion 8: the scope of landscape genetics needs to expand, 251
- 14.10 Conclusion 9: specific hypotheses are rarely stated in current landscape genetic studies, 251
- 14.11 Conclusion 10: a comprehensive theory for landscape genetics is currently missing, 252
- 14.12 The future of landscape genetics, 252
- References, 253
