Prefaces	xiii
About the Companion Website	xix
1 Introduction to the Study of Animal Populations	1
1.1 Population estimates	2
1.1.1 Absolute and related estimates	2
1.1.2 Relative estimates	3
1.1.3 Population indices	4
1.2 Errors and confidence	4
References	5
2 The Sampling Programme and the Measurement and Description of Dispersion	7
2.1 Preliminary sampling	7
2.1.1 Planning and fieldwork	7
2.1.2 Statistical aspects	10
2.2 The sampling programme	16
2.2.1 The number of samples per habitat unit (e.g. plant, host or puddle)	16
2.2.2 The sampling unit, its selection, size and shape	20
2.2.3 The number of samples	21
2.2.4 The pattern of sampling	24
2.2.5 The timing of sampling	26
2.3 Dispersion	27
2.3.1 Mathematical distributions that serve as models	28
2.3.2 Biological interpretation of dispersion parameters	40
2.3.3 Nearest-neighbour and related techniques: measures of population size or of the departure from randomness of the distribution	48
2.4 Sequential sampling	51
2.4.1 Sampling numbers	51
2.5 Presence or absence sampling	55
2.6 Sampling a fauna	57
2.7 Biological and other qualitative aspects of sampling	59
2.8 Jack knife and Bootstrap techniques	60
References	62

3 Absolute Population Estimates Using Capture–Recapture Experiments	77
3.1 Capture–recapture methods	78
3.1.1 Assumptions common to most methods	79
3.1.2 Estimating closed populations	86
3.1.3 Estimations for open populations	93
3.2 Methods of marking animals	103
3.2.1 Handling techniques	105
3.2.2 Release	107
3.2.3 Surface marks using paints and solutions of dyes	108
3.2.4 Dyes and fluorescent substances in powder form	112
3.2.5 Pollen	114
3.2.6 Marking formed by feeding on or absorption of dyes	114
3.2.7 Marking by injection, panjet or tattooing	116
3.2.8 External tags	116
3.2.9 Branding	117
3.2.10 Mutilation	118
3.2.11 Natural marks, parasites and genes	118
3.2.12 Rare elements	119
3.2.13 Protein marking	120
3.2.14 Radioactive isotopes	120
3.2.15 Radio and sonic tags	120
References	121
4 Absolute Population Estimates by Sampling a Unit of Habitat – Air, Plants, Plant Products and Vertebrate Hosts	139
4.1 Sampling from the air	139
4.2 Sampling apparatus	140
4.2.1 Exposed cone (Johnson–Taylor) suction trap	140
4.2.2 Enclosed cone types of suction trap including the Rothamsted 12 m trap	141
4.2.3 Rotary and other traps	143
4.3 Comparison and efficiencies of the different types of suction traps	144
4.3.1 Conversion of catch to aerial density	145
4.3.2 Conversion of density to total aerial population	146
4.4 Sampling from plants	146
4.4.1 Assessing the plant	147
4.4.2 Determining the numbers of invertebrates	147
4.4.3 The extraction of animals from herbage and debris	155
4.4.4 Methods for animals in plant tissues	163
4.4.5 Special sampling problems with animals in plant material	165
4.5 Sampling from vertebrate hosts	166
4.5.1 Sampling from living hosts	166
4.5.2 Sampling from dead hosts	169
4.5.3 Sampling from vertebrate ‘homes’	170
References	171

5 Absolute Population Estimates by Sampling a Unit of Aquatic Habitat	183
5.1 Open water	183
5.1.1 Nets	183
5.1.2 Pumps	187
5.1.3 Water-sampling bottles	187
5.1.4 The Patalas-Schindler volume sampler	187
5.1.5 Particular methods for insects	188
5.2 Vegetation	190
5.2.1 Floating vegetation	191
5.2.2 Emergent vegetation	192
5.2.3 Submerged vegetation	194
5.3 Bottom fauna	195
5.3.1 Hand net sampling of forest litter	196
5.3.2 Sampling from under stones	197
5.3.3 The planting of removable portions of the substrate	199
5.3.4 Cylinders and boxes for delimiting an area	200
5.3.5 Trawls, bottom sledges and dredges	201
5.3.6 Grabs	205
5.3.7 Dendy inverting sampler	208
5.3.8 Box samplers and corers	209
5.3.9 Air-lift and suction devices	211
5.4 Poisons and anaesthetics used for sampling fish in rock pools and small ponds	211
References	213
 6 Absolute Population Estimates by Sampling a Unit of Soil or Litter Habitat: Extraction Techniques	 221
6.1 Sampling	221
6.2 Bulk staining	224
6.3 Mechanical methods of extraction	224
6.3.1 Dry sieving	224
6.3.2 Wet sieving	225
6.3.3 Soil washing and flotation	226
6.3.4 Flotation separation of plankton, meiofauna and other small animals	229
6.3.5 Separation of plant and insects by differential wetting	231
6.3.6 Centrifugation	233
6.3.7 Sedimentation	233
6.3.8 Elutriation	234
6.3.9 Sectioning	235
6.3.10 Aeration	236
6.4 Behavioural or dynamic methods	236
6.4.1 Dry extractors	237
6.4.2 Wet extractors	243
6.5 Summary of the applicability of the methods	248
References	250

7 Relative Methods of Population Measurement and the Derivation of Absolute Estimates	259
7.1 Factors affecting the size of relative estimates	259
7.1.1 The 'phase' of the animal	260
7.1.2 The activity of the animal	261
7.1.3 Differences in the response between species, sexes and individuals	263
7.1.4 The efficiency of the trap or searching method	264
7.2 The uses of relative methods	266
7.2.1 Measures of the availability	266
7.2.2 Indices of absolute population	266
7.2.3 Estimates of absolute population	267
7.2.4 Removal trapping or collecting	268
7.2.5 Collecting	272
7.3 Relative methods: catch per unit effort	272
7.3.1 Observation by radar	272
7.3.2 Hydroacoustic methods	273
7.3.3 Fish counters	274
7.3.4 Electric fishing	274
7.3.5 Aural detection	275
7.3.6 Exposure by plough	276
7.3.7 Collecting with a net or similar device	276
7.3.8 Visual searching and pooting	279
7.4 Relative methods: trapping	280
7.4.1 Interception traps	281
7.4.2 Flight traps combining interception and attraction	290
7.4.3 Light and other visual traps	294
7.5 Traps that attract animals by some natural stimulus or a substitute	304
7.5.1 Shelter traps	304
7.5.2 Trap host plants	305
7.5.3 Baited traps	305
7.5.4 The use of vertebrate hosts or substitutes as bait for insects	308
7.6 Using Sound	314
References	314
 8 Estimates of Species Richness and Population Size Based on Signs, Products and Effects	 337
8.1 Arthropod products	337
8.1.1 Exuviae	337
8.1.2 Frass	338
8.2 Vertebrate products and effects	341
8.3 Effects due to an individual insect	342
8.4 General effects: plant damage	343
8.4.1 Criteria	344
8.5 Determining the relationship between damage and insect populations	347
References	348

9 Wildlife Population Estimates by Census and Distance Measuring Techniques	355
9.1 Census methods	356
9.2 Point and line survey methods	357
9.2.1 Indices of abundance using transects	357
9.2.2 Methods based on flushing	357
9.2.3 Line transect methods: the Fourier series estimator	360
9.2.4 Point transects	365
9.3 Distance sampling software in R	365
9.4 Spatial distribution and plotless density estimators	367
9.4.1 Closest individual or distance method	367
9.4.2 Nearest-neighbour methods	368
References	369
10 Observational and Experimental Methods for the Estimation of Natality, Mortality and Dispersal	373
10.1 Natality	373
10.1.1 Fertility	373
10.1.2 Numbers entering a stage	375
10.1.3 The birth-rate from mark and recapture data	382
10.2 Mortality	382
10.2.1 Total	382
10.2.2 The death-rate from mark and recapture data	383
10.2.3 Climatic factors	383
10.2.4 Biotic factors	383
10.2.5 Experimental assessment of natural enemies	390
10.3 Dispersal	396
10.3.1 Detecting and quantifying jump dispersal	397
10.3.2 Quantifying neighbourhood dispersal	397
10.4 The measurement and description of home range and territory	410
10.4.1 The minimum convex polygon area method for estimating home range	411
10.4.2 The kernel estimation method for home range	412
10.5 The rate of colonisation of a new habitat and artificial substrates	413
10.6 The direction of migration	413
References	413
11 The Construction, Description and Analysis of Age-specific Life-tables	429
11.1 Types of life-table and the budget	429
11.2 The construction of a budget	430
11.3 Analysis of stage-frequency data	431
11.3.1 Southwood's graphical method	432
11.3.2 Richards & Waloff's first method	432
11.3.3 Manly's method	434
11.3.4 Ruesink's method	435

11.3.5	Dempster's method	435
11.3.6	Richards & Waloff's Second Method	436
11.3.7	Kiritani, Nakasuji & Manly's method	437
