Preface

Part 1: Pollen Biology

1. Pollen Development

Differentiation of Anther Layers

Microsporogenesis

Initiation of Meiosis

Synthesis of Macromolecules

Cytoplasmic Reorganization

Syncytium and Isolation

Significance of Cytoplasmic Reorganization and Isolation

Microgametogenesis

Vegetative and Generative Cells

Sperm Cells

Dimorphism of sperm cells and organization of male germ unit

Tapetum

Secretory Tapetum

Plasmodial Tapetum

Tapetal Membrane

Role of Tapetum

Supply of nutrients to developing pollen

Breakdown of callose wall around microspore tetrads

Supply of sporopollenin precursors to pollen exine

Supply of pollen coat substances and exine proteins

Gene Expression during Anther Development

Transmission of Pathogens through Pollen

Pollen Maturation and Anther Dehiscence

2. Pollen Morphology and Aeropalynology

Pollen Morphology

Applications

26

Petroleum exploration	26
Archaeology	26
Criminology	26
Testing purity of honey	27
Three Domains of Pollen Wall	27
Intine	27
Exine	29
Pollen coat substances	29
Pollen Wall Morphogenesis	31
Control of exine pattern	33
Pollen wall proteins	33
Pollen Analysis	33
Pollen size and shape	36
Compound pollen	37
Polarity	38
Apertures	39
Exine sculpture	39
LO analysis	40
Aeropalynology	41
Allergic Response	43
Diagnostic Tests	43
Allergens	44
Biological Standardization of Allergens	45
3. Pollen Viability and Vigour	45
Pollen Viability	46
Tests for Viability	46
Fruit- and seed-set	47
Pollen germination and pollen tube growth in the pistil	47
Non-vital stains and other tests of limited use	47
Tetrazolium test	49
In-vitro germination test	49
Fluorescein diacetate test	50
Causes for Loss of Viability	51
Loss of membrane integrity	53
Quantitative changes in phospholipids	53
Phase transition and membrane integrity	56
Pollen Vigour	56
Tests for Vigour	56
In-vitro germination	57
Semivivo technique	57
In-vivo pollen germination and pollen tube growth	58
Effects of Environmental Stresses on Pollen Quality	61
4. In-vitro Pollen Germination and Pollen Tube Growth	61
Germination Requirements	61
Hydration	61

Carbohydrate Source	62
Boron	64
Calcium	65
Effects of other Physical and Chemical Factors	66
Phases of Germination and Tube Growth	67
Lag Phase	67
Pollen Tube Emergence	68
Pollen Tube Growth	69
Role of cytoskeleton and calcium in tip growth	70
In-vitro vs in-vivo Tube Growth	72
Release of Metabolites	73
RNA and Protein Synthesis	73
In-vitro Pollen Germination Assay to Study the Effects of Toxic Chemicals	76
5. Pollen Sterility	77
Genic Male Sterility	77
Phenotypic Effects of GMS	77
Structural and Biochemical Changes	78
Hormonal Changes	80
Effects of Temperature and Photoperiod	80
Induction of Pollen Sterility through Recombinant DNA Technology	80
Cytoplasmic Male Sterility	82
Alterations in Mitochondrial Genome	84
Structural and Biochemical Changes	85
Mechanism of Cytoplasmic Male Sterility	87
Environmentally Induced Pollen Sterility	89
Chemically Induced Pollen Sterility	89
6. Pistil	90
Stigma	90
Style	93
Ovule and Embryo Sac	98
7. Pollination	102
Breeding Systems	104
Outbreeding Devices	104
Secondary Pollen Presentation	104
Pollen:Ovule Ratio	105
Modes of Pollination	105
Anemophily	105
Hydrophily	105
Zoophily	106
Evolutionary Significance of Insect Pollination	109
Floral Attractants and Rewards	110
Floral Thermogenicity	111
Pollen Travel and Gene Flow	111
Pollination Postulates	113

Pollination Efficiency	113
8. Pollen-Pistil Interaction and Fertilization	114
Significance of pollen-Pistil Interaction	114
Screening for Compatibility	115
Screening for Quality	115
Pollen Viability and Stigma Receptivity	117
Events on Stigma Surface	118
Pollen Adhesion and Hydration	118
Pollen Germination and Pollen Tube Entry into Stigma	119
Pollination Stimulus	120
Pollen Tube Growth through Style	121
Regulation of Pollen Tube Number	124
Internal Geitonogamy	125
Pollen Tube Guidance	125
On Stigma Surface	127
In Ovary	128
Pollen Tube Entry into Ovule and Embryo Sac	130
Double Fertilization	131
Preferential Fertilization	131
Inheritance of Plastids	132
Positional Effect of Ovules	133
In-vitro Pollination and Fertilization	133
In-vitro Pollination	134
Pollination of cultured pistils	134
Pollination of cultured ovules	134
In-vitro Fertilization	137
Applications of in-vitro Pollination and Fertilization	138
9. Self-incompatibility	140
Evolution of SI	140
Homomorphic SI	141
Genetics	141
Cytology	144
Physiological and Biochemical Studies	146
Temporal Expression of SI	148
Operation of SI	149
Characterization of S-allele Products and S-alleles in Pistil	149
Sporophytic systems	149
Gametophytic systems	152
Papaver system	153
S-allele-specific components in pollen	153
Basis of S-allele Specificity	154
Mechanism of Pollen Recognition and Inhibition	154
Heteromorphic SI	158
Dimorphic Systems	158
Trimorphic Systems	163

Zone of Inhibition	163
Mechanism of Inhibition	165
Passive inhibition	165
Combination of passive and active inhibition	166
10. Interspecific Incompatibility	167
Prefertilization Barriers	167
Unilateral Incompatibility	167
Incongruity/Passive Inhibition	168
Mechanism of Passive Inhibition	170
Post-fertilization Barriers	175
Part II: Pollen Biotechnology	
11. Optimization of Crop Yield	181
Enhancing Populations of Native Pollinators through Habitat Management	181
Use of Commercially Managed Pollinators	182
Spraying Pollinator Attractants on Target Crop	183
Introduction of Pollinators	184
Supplementary Pollination/Assisted Pollination	184
12. Commercial Production of Hybrid Seeds	186
Use of Genic Male Sterility	187
Vegetative/Micropropagation of Female Lines	188
Use of Phenotypic Markers	189
Environmental/Hormonal Induction of Male Fertility	189
Use of Cytoplasmic Male Sterility	189
Use of Self-incompatibility	190
Methods to Overcome SI	191
Selection of Lines with Strong SI Alleles	193
Transfer of SI Alleles to Self-compatible Species	193
Hybrid Seed Production in Monoecious Species	193
Manipulation of Sex-expression for Yield Improvement	194
Use of Pollen Sterility Induced through r-DNA Technology	194
Use of Pollen Sterility Induced through Chemical Hybridizing Agents	194
Proline Analogues	195
Phenyl Pyridazones	195
Phenylcinnoline Carboxylates	196
LY 195259	196
MON 21200	196
Potential of Apomixis in Hybrid Seed Technology	196
13. Transfer of Useful Genes to Crop Species	199
Use of Pollen for Identifying Plants with Desirable Genes	200
Production of Hybrids	202
Effective Techniques to Overcome Physical Barriers	203
Pollen storage	204
Effective Techniques to Overcome Prefertilization Barriers	206

Application of growth substances and other chemicals	207
Use of mentor pollen	208
Stump pollination	208
Stylar grafting	209
Bridge crosses	209
Bud pollination	210
Intraovarian pollination	210
In-vitro pollination of ovules	210
In-vitro fertilization	210
Methods to Overcome Post-fertilization Barriers	211
Multiplication of Hybrids	211
Identification of Hybrids at Seedling Stage	212
Induction of Amphiploidy	212
Handling of Backcross Generations	212
Application of selection pressure to pollen	213
Stabilization of Recombinants	215
Use of Pollen for Genetic Transformation	215
Mature Pollen Grains	216
Microspores and Microspore-derived Embryos	217
14. Induction of Haploids from Pollen Grains	219
Importance of Haploids	219
Production of Homozygous Diploids	219
Recovery of Novel Recombinants	219
Mutation Research	220
Model System to Study Embryogenesis	220
Production of Artificial Seeds and Genetic Transformation	220
Production of Haploids	220
Use of Genetic Lines	220
Chromosome Elimination	221
Culture of Anthers and Microspores	222
Optimal Conditions for Induction of Pollen Embryos	223
Pollen dimorphism	225
Diploidization	225
Developmental Pathways	225
Production of Haploids through Gynogenesis	227
Utilization of Haploids	229
15. Production of Other Economic Products	231
Pollen as Health Food Supplement	231
Pollen as Medicine	231
Pollen Grains/Pollen Allergens for Diagnosis and Therapy	233
Treatment of Pollen Allergy	233
Pollen Calendars	234
References	237
Index	285
