

CONTENTS

Preface	xi
Chapter 1: Enzymes	1
Excursus:	
1-1. Cell fractionation	10
1-2. Emil Fischer, Franz Hofmeister, and the peptide bond	11
1-3. Spatial structures of polypeptides	11
1-4. X-ray diffraction analysis	18
1-5. Pascual Jordan's mistake	22
Chapter 2: Genes	23
Excursus:	
2-1. <i>Escherichia coli</i> : an example of a self-replicating machine	28
2-2. A brief digression: where does the energy come from?	31
2-3. Mendel	33
2-4. Chromosome maps	38
2-5. The early biochemistry of the cell nucleus	42
Chapter 3: One Gene – One Enzyme	44
Excursus:	
3-1. The replica plate technique (Lederberg & Lederberg, 1952)	53
3-2. Proof of contact between parental cells during bacterial conjugation – and the discovery of transduction	54
Chapter 4: Phages	56
Excursus:	
4-1. Bacteriophages	69
4-2. The quest for the origin of mutations: Luria and Delbrück's fluctuation test	74
4-3. Phage-directed protein synthesis	76
Chapter 5: The Double Helix	78

Chapter 6: Double Helix: the Anticlimax	90
Excursus:	
6-1. A corollary of Watson and Crick's model: the insight that errors in base-pairing can lead to mutations	94
6-2. The replication mode of DNA	96
6-3. Denaturation, renaturation, and hybridization of DNA	100
Chapter 7: Avery? Hershey?	103
Excursus:	
7-1. The transforming principle is DNA	108
7-2. Hershey & Chase's (1952) blender experiment	112
Chapter 8: The Code Craze	114
Excursus:	
8-1. One mutation alters hemoglobin in only one amino acid	125
8-2. Linearity...Colinearity	125
Chapter 9: Protein Synthesis <i>in vitro</i> . How did it all start?	132
Excursus:	
9-1. Polypeptide synthesis proceeds from the amino- to the carboxy-terminal	138
Chapter 10: The Code <i>in vitro</i>	140
Excursus:	
10-1. How does polypeptide synthesis occur on the ribosome?	150
Chapter 11: Inside the Institut Pasteur, Part I: Prophage and the Fertility Factor F	154
Excursus:	
11-1. Parasites at the genetic level	159
Chapter 12: Inside the Institut Pasteur, Part II: Interrupted Mating	164
Excursus:	
12-1. A method for isolating Hfr strains	169
12-2. Episomes and plasmids: the Campbell model	170

Chapter 13: Inside the Institut Pasteur, Part III: The Fermentation of Lactose	173
Chapter 14: Inside the Institut Pasteur, Part IV: mRNA	182
Excursus:	
14-1. Ribosomal RNA is stable (Davern & Meselson, 1960)	186
14-2. A novel, unstable species of RNA	187
14-3. rRNA-DNA & tRNA-DNA hybrid helices	189
Chapter 15: The Operon	191
Chapter 16: RNA Polymerase	197
Chapter 17: The Coronation: DNA Replication	203
Chapter 18: That was the Molecular Biology that was	212
Chapter 19: R & M	217
Chapter 20: Molecular Clones	227
Excursus:	
20-1. Restriction enzymes and DNA cloning: The beginning of gene technology	231
20-2. How molecular cloning almost became superfluous: PCR	234
Chapter 21: Beyond Coli	236
Excursus:	
21-1. The eucytes	240
21-2. Nucleosomes, chromosome structure	242
21-3. Split genes: exons and introns	248
21-4. Who is Bob Tjian?	255

Chapter 22: Sequences	258
Excursus:	
22-1. Sanger's DNA sequencing techniques	264
22-2. "Footprinting": demonstration of contact sites between DNA-binding proteins and their specific DNA sequences	270
Chapter 23: HUGO & ELSI	272
Excursus:	
23-1. Some gossip: Watson's downfall (or a modern fairy tale)	280
Chapter 24: Outlook on the twenty-first Century	283
Glossary	287
