|--------------------------------------------------------|--------|
| Preface.....                                           | xi     |
| Acknowledgments.....                                   | xiii   |
| About the Author .....                                 | xv     |
| <br><b>Chapter 1</b> Definitions of Life .....         | <br>1  |
| Introduction .....                                     | 1      |
| RNA and Life .....                                     | 4      |
| Detecting Life.....                                    | 6      |
| Defining Life .....                                    | 9      |
| Imagining Cellular and Molecular Dimensions.....       | 14     |
| Key Points .....                                       | 17     |
| <br><b>Chapter 2</b> Earth and Evolution.....          | <br>19 |
| Introduction.....                                      | 19     |
| What Is Evolution? .....                               | 19     |
| Earth History.....                                     | 22     |
| A Short History of the Study of Evolution.....         | 31     |
| Earth History as One Year .....                        | 38     |
| Key Points .....                                       | 40     |
| <br><b>Chapter 3</b> DNA → RNA → Proteins.....         | <br>43 |
| Introduction .....                                     | 43     |
| Nucleic Acids.....                                     | 45     |
| Translation.....                                       | 55     |
| Amino Acids and Polypeptides .....                     | 57     |
| Lipids.....                                            | 59     |
| Carbohydrates.....                                     | 59     |
| Key Points .....                                       | 62     |
| <br><b>Chapter 4</b> The Central Dogma and Beyond..... | <br>63 |
| Introduction .....                                     | 63     |
| Ribosomal RNA (rRNA) .....                             | 63     |
| Transfer RNA (tRNA) .....                              | 72     |
| Messenger RNA (mRNA) .....                             | 73     |
| Other Small Noncoding RNA (ncRNA) .....                | 77     |
| Beyond the Central Dogma .....                         | 80     |
| Key Points .....                                       | 80     |

|                  |                                                                |     |
|------------------|----------------------------------------------------------------|-----|
| <b>Chapter 5</b> | Evolution of Ribosomes, Ribosomal RNA, and Translation.....    | 81  |
|                  | Introduction .....                                             | 81  |
|                  | Ribosomes as Ribozymes.....                                    | 84  |
|                  | Translation.....                                               | 84  |
|                  | Origin of the Ribosome.....                                    | 87  |
|                  | Evolution of the Genetic Code .....                            | 89  |
|                  | Why a Triplet Codon? .....                                     | 90  |
|                  | How Many rRNA Copies Are Needed? .....                         | 92  |
|                  | Specific Mechanisms for Increasing rRNA Gene Copy Number ..... | 95  |
|                  | Complexity of Ribosomes .....                                  | 97  |
|                  | Key Points .....                                               | 100 |
| <b>Chapter 6</b> | DNA Replication .....                                          | 101 |
|                  | Introduction .....                                             | 101 |
|                  | Variations of Replication.....                                 | 106 |
|                  | Topology during Replication.....                               | 113 |
|                  | Replication of Chromosomes .....                               | 113 |
|                  | Key Points .....                                               | 115 |
| <b>Chapter 7</b> | DNA Segregation .....                                          | 117 |
|                  | Introduction .....                                             | 117 |
|                  | Variations on DNA Segregation in Bacteria (and Archaea).....   | 117 |
|                  | Mitosis .....                                                  | 120 |
|                  | Variations on Mitosis and the Cell Cycle.....                  | 123 |
|                  | Variations on Chromosome Number.....                           | 125 |
|                  | Changes in DNA Amount during the Cell Cycle.....               | 127 |
|                  | Meiosis .....                                                  | 130 |
|                  | Key Points .....                                               | 133 |
| <b>Chapter 8</b> | Changes to DNA .....                                           | 135 |
|                  | Introduction .....                                             | 135 |
|                  | Causes of Mutations .....                                      | 139 |
|                  | Mutation during Replication .....                              | 145 |
|                  | Effects of Mutations .....                                     | 146 |
|                  | DNA Repair.....                                                | 147 |
|                  | Genetic Recombination .....                                    | 149 |
|                  | Key Points .....                                               | 153 |
| <b>Chapter 9</b> | Viruses, Plasmids, Transposons, and Introns.....               | 155 |
|                  | Introduction .....                                             | 155 |
|                  | Viruses.....                                                   | 161 |
|                  | Introns .....                                                  | 165 |

|                                                                     |     |
|---------------------------------------------------------------------|-----|
| Transposable Elements (Transposons and Retrotransposons) .....      | 176 |
| Plasmids .....                                                      | 179 |
| Horizontal Gene Transfers .....                                     | 182 |
| Key Points .....                                                    | 183 |
| <b>Chapter 10 Species, Taxonomy, and Gene Flow</b> .....            | 185 |
| Introduction .....                                                  | 185 |
| What Is a Species? .....                                            | 185 |
| Classification of Life .....                                        | 188 |
| Reconstruction of Evolutionary History .....                        | 190 |
| Gene Flow .....                                                     | 192 |
| Key Points .....                                                    | 194 |
| <b>Chapter 11 Multigene Families</b> .....                          | 195 |
| Introduction .....                                                  | 195 |
| Ribosomal RNA Gene Family .....                                     | 197 |
| Globin Gene Family .....                                            | 198 |
| Bacterial Flagella Gene Family .....                                | 204 |
| Laccase Gene Family .....                                           | 205 |
| Histone Gene Family .....                                           | 205 |
| Orthologs and Paralogs .....                                        | 206 |
| Key Points .....                                                    | 207 |
| <b>Chapter 12 Phylogenetics: Evolutionary Reconstructions</b> ..... | 209 |
| Introduction .....                                                  | 209 |
| Tree Terminology .....                                              | 209 |
| Choosing Genomic Region .....                                       | 211 |
| Aligning Sequences .....                                            | 218 |
| Other Considerations When Performing Phylogenetic Analyses ....     | 219 |
| Analyzing the Aligned Sequence .....                                | 220 |
| UPGMA (Unweighted Pair Group Method<br>with Arithmetic Mean) .....  | 221 |
| Neighbor Joining .....                                              | 222 |
| Maximum Parsimony .....                                             | 222 |
| Maximum Likelihood (ML) .....                                       | 225 |
| Bayesian Phylogenetic Analysis .....                                | 226 |
| Bootstrapping .....                                                 | 227 |
| Vertical versus Horizontal Evolutionary Events .....                | 228 |
| Key Points .....                                                    | 229 |
| <b>Chapter 13 Genomes I: RNA Viruses</b> .....                      | 231 |
| Introduction .....                                                  | 231 |
| C-Value Paradox .....                                               | 234 |

|                                                                |            |
|----------------------------------------------------------------|------------|
| Genomics.....                                                  | 235        |
| RNA Virus Genome.....                                          | 235        |
| HIV.....                                                       | 236        |
| Influenza A.....                                               | 240        |
| Ebola.....                                                     | 245        |
| Key Points.....                                                | 247        |
| <b>Chapter 14 Genomes II: DNA Viruses.....</b>                 | <b>249</b> |
| Introduction.....                                              | 249        |
| Bacteriophage $\phi$ X174.....                                 | 249        |
| Bacteriophage lambda ( $\lambda$ ).....                        | 252        |
| Bacteriophage T4.....                                          | 258        |
| Mimivirus.....                                                 | 261        |
| Key Points.....                                                | 264        |
| <b>Chapter 15 Genomes III: Bacteria and Archaea.....</b>       | <b>265</b> |
| Introduction.....                                              | 265        |
| <i>Escherichia coli</i> .....                                  | 265        |
| Photosynthetic Bacteria.....                                   | 268        |
| Aquifex.....                                                   | 270        |
| Euryarchaeota.....                                             | 270        |
| Crenarchaeota.....                                             | 274        |
| Key Points.....                                                | 275        |
| <b>Chapter 16 Genomes IV: Mutualists and Pathogens.....</b>    | <b>277</b> |
| Introduction.....                                              | 277        |
| Termite Gut Microbes.....                                      | 279        |
| Smallest Bacterial Genome.....                                 | 279        |
| Co-Resident Symbionts.....                                     | 282        |
| Animal Parasite.....                                           | 283        |
| Genome Mixing and Sorting.....                                 | 285        |
| Key Points.....                                                | 287        |
| <b>Chapter 17 Genomes V: Endosymbionts and Organelles.....</b> | <b>289</b> |
| Introduction.....                                              | 289        |
| Intracellular Endosymbiont.....                                | 289        |
| Mitochondria.....                                              | 294        |
| How Many Genes Make a Functional Mitochondrion?.....           | 298        |
| Chloroplasts.....                                              | 302        |
| How Many Genes Make a Functional Chloroplast?.....             | 304        |
| Differential Development and Function.....                     | 307        |
| Chimeric Pathways.....                                         | 308        |

|                                                          |            |
|----------------------------------------------------------|------------|
| Endosymbioses Leading to Other Organelles Evolution..... | 309        |
| Key Points .....                                         | 311        |
| <b>Chapter 18 Genomes VI: Eukaryotic Genomes.....</b>    | <b>313</b> |
| Introduction .....                                       | 313        |
| Origin of the Nucleus and Mitochondrion .....            | 314        |
| Multicellularity.....                                    | 317        |
| Chromalveolates.....                                     | 319        |
| Ophisthokonta .....                                      | 320        |
| <i>Saccharomyces Cerevisiae</i> .....                    | 320        |
| <i>Caenorhabditis Elegans</i> .....                      | 323        |
| <i>Drosophila Melanogaster</i> .....                     | 326        |
| <i>Homo Sapiens</i> .....                                | 327        |
| Plantae (archaeplastida).....                            | 329        |
| <i>Arabidopsis Thaliana</i> .....                        | 329        |
| <i>Oryza Sativa</i> .....                                | 332        |
| Key Points .....                                         | 335        |
