

Contents

Preface: Why Read This Book?.....	xv
Acknowledgments	xvii
Author	xix
Contributors	xxi

Chapter 1	Introduction and Background	1
1.1	Basic Biochemistry	1
1.1.1	Molecules Important to Molecular Biophysics	1
1.1.2	Making Use of Functional Groups	9
1.2	Energies and Potentials	9
1.2.1	Biologically Relevant Energy Scales.....	9
1.2.2	A Quantum Mechanical Description of Bonding: Molecular Orbital Theory	10
1.2.3	Ionic Bonds.....	12
1.2.4	Ion-Dipole Interactions.....	12
1.2.5	Dipole-Dipole Interactions	13
1.2.6	Hydrogen Bonds.....	14
1.2.7	Cation-Pi Interaction.....	14
1.2.8	The (Strept)avidin/Biotin Interaction.....	15
1.3	Principles of Spectroscopy	17
1.3.1	What Can Be Measured?	17
1.3.2	How Are Transitions Measured?	18
1.4	Cells	19
1.5	DNA, RNA, Replication, and Transcription.....	21
1.5.1	The Structure and Function of DNA and RNA ...	21
1.5.2	Replication	24
1.5.3	Transcription	25
1.6	Translation and the Genetic Code	27
1.7	Protein Folding and Trafficking	29
1.8	Alternative Genetics	33
1.9	What Is Cloning?	34
1.10	Design of a Molecular Biology Experiment and How to Use This Book	35
	Questions and Problems	36
	Background Reading	38

Chapter 2	Molecular Cloning of DNA and RNA.....	41
2.1	Introduction.....	41
2.2	Obtaining and Storing Plasmids.....	43

2.3	Selection of an Appropriate <i>E. coli</i> Amplification	
	Strain: Transformation of <i>E. coli</i> with Plasmid	45
2.3.1	Transformation	45
2.3.2	Selection	46
2.3.3	Transformation Efficiency	47
2.4	Plasmid Amplification and Purification	47
2.4.1	Amplification	47
2.4.2	Purification	49
2.4.3	Measuring Concentration and Purity of Extracted DNA	50
2.5	Plasmid Restriction Mapping and Agarose Gel Electrophoresis	51
2.5.1	Restriction Enzymes	51
2.5.2	Screening Purified DNA	52
2.5.3	Separation of Restriction Fragments for Ligation	53
2.6	An Example of Cloning Experiment	55
2.6.1	Determining a Cloning Strategy	55
2.6.2	Digestion and Purification of Fragments	56
2.6.3	Determination of Parameters for Optimal Ligation	56
2.7	Cloning by the Polymerase Chain Reaction	59
2.8	Sequencing	61
2.9	RNA Methods	63
2.10	Southern and Northern Blots	65
2.11	Solutions for Large Cloning Problems and Multiple Inserts	66
2.11.1	Phage Vectors	66
2.11.2	Cosmids	69
2.11.3	Bacterial Artificial Chromosomes	69
2.12	Mutagenesis and Directed Evolution	70
2.12.1	Site-Directed Mutagenesis	71
2.12.2	When Point Mutations Are Not Enough	72
2.13	Microarrays	73
2.14	Summary and Hints	74
	Questions and Problems	74
	Background Reading	75
Chapter 3	Expression of Genes in Bacteria, Yeast, and Cultured Mammalian Cells	81
3.1	Introduction	81
3.2	Expressing Genes in Microorganisms	82
3.2.1	<i>Escherichia coli</i>	82
3.2.2	Other Bacterial Strains	82
3.2.3	Yeast Cells	90
3.3	Mammalian Cell Culture	93
3.3.1	An Introduction to Immortalized Cell Lines	93
3.3.2	Primary Cultures	95
3.3.3	Explants and Slices	100
3.3.4	Stem Cells	102

3.4	Transfection of Mammalian Cells I: Standard Techniques	104
3.4.1	Introduction	104
3.4.2	Cationic Liposomes	105
3.4.3	Stable Transfection	110
3.4.4	Example Experiment: Transfecting Chinese Hamster Ovary Cells with LacZ and GFP	111
3.4.5	Electroporation of Cell Cultures: Not Recommended by the Authors	114
3.4.6	Microinjection of DNA and RNA	114
3.5	Transfection of Mammalian Cells II: Specialized Physical Methods for Special Occasions	117
3.5.1	Magnetofection and Nanotube Sparring	117
3.5.2	Optical Transfection	118
3.5.3	Gene Gun	118
3.6	Transfection of Mammalian Cells III: Viruses	120
3.6.1	Lentivirus	122
3.6.2	Some Other Types of Viruses Used as Vectors	126
3.7	Summary	129
	Questions and Problems	130
	Background Reading	131
Chapter 4	Protein Expression Methods	137
4.1	Introduction	137
4.2	Expression Systems	137
4.2.1	Bacteria	137
4.2.2	Yeast	138
4.2.3	Insect Cells	138
4.2.4	Mammalian Cells	138
4.2.5	<i>In Vitro</i>	138
4.3	Identification of a DNA Source	139
4.4	Selecting an Expression Vector	139
4.4.1	Promoters	139
4.4.2	Protein Tags	141
4.4.2.1	His-Tag	142
4.4.2.2	GST-Tag	142
4.4.2.3	CBD-Tag	142
4.4.2.4	Epitope Tags	142
4.4.3	Vector Selection	143
4.5	Sub-Cloning into an Expression Vector	143
4.6	Selection of an Expression Strain or Cell Line	143
4.6.1	Bacterial Strains	143
4.6.1.1	BL21(DE3)	144
4.6.1.2	Origami(DE3)	144
4.6.1.3	Rosetta(DE3)	144
4.6.1.4	Tuner(DE3)	144
4.6.1.5	Rosetta-gami(DE3)	144
4.6.2	Yeast	144
4.6.3	Insect Cells	144
4.6.4	Mammalian Cells	145

4.7	Protein Expression.....	145
4.8	SDS-PAGE.....	147
4.8.1	Protein Separation.....	147
4.8.2	Protein Visualization.....	149
4.9	Protein Isolation and Purification.....	151
4.9.1	Native vs. Nonnative Purification.....	151
4.9.2	Preparation of Protein Lysate.....	152
4.10	Chromatography.....	153
4.10.1	Chromatography Systems.....	153
4.10.2	Affinity Chromatography.....	154
4.10.3	Size-Exclusion Chromatography.....	155
4.11	Buffer Exchange and Concentration.....	156
4.11.1	Buffer Exchange.....	156
4.11.2	Protein Concentration.....	157
4.12	Example Experiment: Expression and Purification of Fluorescent Protein Dronpa.....	158
4.13	Conclusions and Final Remarks.....	161
	Background Reading.....	162
Chapter 5	Protein Crystallization.....	165
5.1	Introduction.....	165
5.2	Crystallization of Macromolecules.....	167
5.2.1	General Concerns and Motivations.....	167
5.2.2	Vapor Diffusion.....	169
5.2.3	Interface Diffusion.....	172
5.2.4	Microbatch.....	172
5.2.5	Dialysis.....	172
5.3	Preparation of Proteins for Crystallization.....	172
5.3.1	Protein Purity.....	173
5.3.2	Monodispersity.....	174
5.3.3	Protein Quantity.....	177
5.3.4	Protein Variability.....	177
5.4	Components of Crystallization Solutions.....	178
5.4.1	Precipitant.....	178
5.4.2	Buffer.....	179
5.4.3	Salt.....	179
5.5	Other Factors Affecting Crystallization.....	181
5.5.1	Protein Concentration.....	181
5.5.2	Diffusion Rate.....	181
5.5.3	Temperature.....	182
5.5.4	Vibrations.....	182
5.5.5	Mechanical Contaminants.....	182
5.5.6	Solution Quality.....	183
5.6	Crystallization Strategies.....	183
5.6.1	Initial Screening.....	183
5.6.2	Pitfalls.....	187
5.6.3	Fine-Screening.....	187
5.6.4	Additive Screens.....	190

5.6.5	Seeding	190
5.6.6	Improving the Protein	191
5.6.7	Obtaining Different Crystal Forms of the Same Protein	191
5.7	Example Experiment: Lysozyme	192
5.8	Data Collection and Structure Determination Using X-Ray Crystallography	194
5.8.1	Where to Do X-Ray Crystallography	194
5.8.2	Protecting Crystals from Radiation Damage	194
5.9	A Special Case: Membrane Proteins	196
5.10	Troubleshooting Q&A	198
5.11	Conclusions and Final Remarks	199
	Questions and Problems	199
	Background Reading	200
Chapter 6	Introduction to Biological Light Microscopy	205
6.1	Introduction	205
6.2	The Physics of Microscopy: Magnification and Resolution	205
6.3	Anatomy of a Biological Microscope	210
6.3.1	The Hardware	210
6.3.2	Imaging Cells on an Inverted Microscope	211
6.4	Brightfield Imaging Techniques	213
6.4.1	Köhler Illumination	213
6.4.2	Brightfield and Darkfield	214
6.4.3	Phase Contrast	218
6.4.4	Polarization and Differential Interference Contrast	221
6.5	Basic Fluorescence Microscopy	224
6.5.1	The Physics of Fluorescent Molecules	224
6.5.2	Epifluorescence Microscopy	229
6.5.3	Confocal Laser Scanning Microscopy	235
6.6	Fluorophores for Cell Labeling	240
6.6.1	Autofluorescence	240
6.6.2	Traditional Organic Dyes	240
6.6.3	New-Generation Fluorescent Dyes	243
6.6.4	Attaching Dyes to Cell-Targeting Molecules	244
6.6.5	Organelle Probes	247
6.6.6	Environmental Probes	250
6.7	Fluorescent Proteins	252
6.8	Multispectral Imaging Using Acousto-Optical Tunable Filters	256
6.9	Advanced Techniques	258
6.9.1	Fluorescence Resonance Energy Transfer Microscopy	258
6.9.2	Two-Photon Microscopy	259

6.9.3	Total Internal Reflection Microscopy	260
6.9.4	Fluorescence Photoactivation Localization Microscopy	260
6.9.5	Fluorescence Lifetime Imaging	261
6.9.6	4Pi Microscopy	261
6.10	Summary and Remarks	261
	Questions and Problems	261
	Background Reading	262
Chapter 7	Quantitative Cell Culture Techniques	273
7.1	Introduction	273
7.2	Quantifying Bacterial Growth and Death	273
7.2.1	Quantifying Bacterial Concentrations	273
7.2.2	Bacterial Growth Curves	275
7.2.3	Bacterial Inhibition Curves and Modeling	276
7.2.4	IC ₅₀ and Minimum Inhibitory Concentration	278
7.3	Quantifying Mammalian Cells	280
7.3.1	Counting Mammalian Cells	280
7.3.2	Endpoint Methods for Mammalian Cells: The Sulforhodamine B Assay and Other Colorimetric Methods	281
7.3.3	Real-Time Measurements of Mammalian Cell Growth and Death	283
7.4	Flow Cytometry	288
7.5	Example Experiment: Determining Leukemic B-Cells and T-Cells by Flow Cytometry	291
7.6	Quantifying Viruses	295
7.6.1	Titering Viral Vectors	295
7.6.2	Titering Phage by Plaque Assay	296
7.6.3	Titering Adenovirus by Plaque Assay	297
7.6.4	Titering Adenovirus by Optical Density	298
7.6.5	Titering Lentiviral Vectors by Flow Cytometry	298
7.6.6	Titering Retroviruses Expressing a Selectable Marker	300
7.6.7	Titering Lentivirus Using p24	300
7.7	Measuring Cell Populations Using Quantitative PCR	301
7.8	Summary and Final Remarks	303
	Questions and Problems	303
	Background Reading	304
Chapter 8	Semiconductor Nanoparticles (Quantum Dots)	309
8.1	Introduction	309
8.2	Quantum Dot Properties and Synthesis	309
8.2.1	Physics of Quantum Dots	309
8.2.2	Synthesis of Quantum Dots	313

8.2.3	Determination of Quantum Dot Size and Concentration	315
8.2.4	Solubilization and Biofunctionalization of Quantum Dots	318
8.2.5	Commercial QDs	323
8.3	QD Applications	324
8.3.1	Single-Particle Tracking	324
8.3.2	QD Delivery to Living Cells	325
8.3.3	Multicolor Labeling and Avoidance of Autofluorescence	329
8.3.4	Correlated Fluorescence and Electron Microscopy	330
8.3.5	Quantum Dots as Biosensors	332
8.4	Example Experiment: Conjugation of Quantum Dots to Dopamine and Quantifying the Effects on Fluorescence per Molecule Bound	336
8.5	Summary and Remarks	339
	Questions and Problems	340
	Background Reading	340
Chapter 9	Gold Nanoparticles	345
9.1	Introduction	345
9.2	The Physics of Scattering and Spherical Metal Nanoparticles	346
9.2.1	General Theory for All Particles	346
9.2.2	Simplifications for Nanosized Particles	348
9.3	Synthesis of Gold Nanoparticles	354
9.4	Characterization and Surface Modification of Gold Nanoparticles	359
9.4.1	Recommended Characterization Techniques ...	359
9.4.2	Surface Stabilization and Biocompatibility	360
9.4.3	Targeting Schemes	361
9.5	Applications for Colorimetric Detection and Microscopy	362
9.5.1	Metal Nanoparticles as Local Sensors	362
9.5.2	Darkfield Microscopy	363
9.5.3	Prospects for High-Speed Imaging	365
9.5.4	Confocal Microscopy	366
9.6	Sample Experiment: Labeling Cells with Lectin-Tagged Au Nanoparticles	367
9.7	Applications in Surface-Enhanced Raman Scattering	368
9.7.1	Introduction to Raman Scattering	368
9.7.2	Protected Raman-Active Nanospheres	372
9.7.3	SERS Nanoparticles: Beyond Spheres	373
9.8	Gold Nanoparticles as Photothermal Transducers	375
9.9	Conclusion	376
	Questions and Problems	377
	Background Reading	377

Chapter 10	Surface Functionalization Techniques	383
10.1	Introduction	383
10.2	Preparing Monolayers Using Functional Silanes or Thiols	384
10.2.1	Silanes	384
10.2.2	Alkanethiol Self-Assembled Monolayers	386
10.2.3	Some Special Considerations	391
10.2.3.1	Site-Specific Patterning on Si/SiO ₂	391
10.2.3.2	Silanized Surfaces Other than Silicon or Glass (Polymers)	391
10.2.3.3	Fragile Features	391
10.3	Techniques for Characterizing Surface Monolayers	392
10.3.1	Interaction with Reactive Dyes	392
10.3.2	Ellipsometry	393
10.3.3	Contact Angle	394
10.3.4	X-Ray Photoelectron Spectroscopy	395
10.3.5	Scanning Probe Microscopy	396
10.3.6	Other Methods	399
10.4	Functionalization of Modified Surfaces Using Cross-Linkers	401
10.4.1	Types of Cross-Linkers	401
10.4.2	Controlling Protein Orientation	403
10.5	Example Experiment: Preparing a Silane-Biotin-Streptavidin Sandwich on SiO ₂ Features on a Si Chip	407
10.5.1	Observing and Cleaning the Substrate	407
10.5.2	Silanization	408
10.5.3	Biotinylation and Blocking	408
10.5.4	Assembling Streptavidin, Final Characterization, and Using the Sensor	410
10.5.5	Variations on a Theme	410
10.5.6	Micropatterning	412
10.6	Preventing Nonspecific Binding of Biomolecules	413
10.7	Assembling Membrane Proteins on Surfaces	415
10.7.1	The Problem	415
10.7.2	Cushioned Bilayers	417
10.7.3	Tethered Bilayers	419
10.7.4	Improving Lipid Stability	420
10.8	Testing the Function of Immobilized Proteins	421
10.8.1	Specific Binding: Quantity and Kinetics	421
10.8.2	Enzymatic Function	421
10.8.3	Electrochemistry	421
10.8.4	Ion Channel Function	421
10.9	Conclusion and Final Remarks	422
	Questions and Problems	422
	Background Reading	423

Chapter 11	Electrophysiology	429
11.1	Introduction	429
11.2	Physical Basis and Circuit Models	431
11.2.1	Cell Circuit Models	431
11.2.1.1	Simple Vesicle	431
11.2.1.2	Vesicle with One Channel Type	432
11.2.1.3	Vesicle with Two Channel Types	433
11.2.1.4	Real Cells	434
11.2.2	Types of Recording: Bilayers, Single-Channel Patches, and Whole Cell	435
11.2.3	Voltage Clamp and Current Clamp	436
11.2.4	Issues of Space Clamp	437
11.3	Solutions and Blockers	439
11.3.1	Internal and External Solutions	439
11.3.1.1	Internal Solutions	439
11.3.1.2	External Solutions	440
11.3.2	Junction Potential	440
11.3.3	Blockers, Agonists, and Antagonists	442
11.4	Instrumentation	443
11.4.1	Amplifiers	443
11.4.2	Grounding and Shielding	446
11.4.3	Micromanipulators	448
11.5	Lipid Bilayer Setup	449
11.5.1	General Principles and Use	449
11.5.2	Making the Lipid Bilayer	451
11.5.3	Monitoring Bilayer Formation Electrically	453
11.5.4	Adding Ion Channels	454
11.6	Cell Patch-Clamp Setup: What Is Needed?	456
11.6.1	Microscope	457
11.6.2	Micromanipulator	458
11.6.3	Electrodes	458
11.6.4	Pipette Holder	459
11.6.5	Perfusion/Drug Application	459
11.7	The Art and Magic of Pipette Pulling	461
11.7.1	Pullers and Glass	461
11.7.2	Making Patch Pipettes	462
11.7.3	Sylgard	464
11.7.4	Recording Artifacts Caused by Pipette Materials	464
11.8	Step-by-Step Guide to Performing a Whole-Cell Recording	465
11.9	Example Experiment: Whole-Cell Recording on Cells Transfected with K ⁺ Channels and GFP	467
11.10	A Brief Introduction to Single-Channel Modeling and Data Analysis	469
11.10.1	Why Do Single-Channel Measurements?	469

11.10.2	Analyzing Data.....	470
11.10.3	Interpreting Single-Channel Data.....	473
11.11	Network Recording.....	474
11.11.1	Multielectrode Arrays.....	474
11.11.2	Optical Recording.....	474
11.11.3	Optogenetics: Voltage-Sensitive Reporters.....	476
11.11.4	Injecting Currents Using Genetically Encoded Proteins.....	479
11.11.5	Optical Noise in Network Recordings.....	479
11.11.6	More Emerging Techniques for Neuronal Recording and Stimulation.....	480
11.12	Conclusions and Final Remarks.....	481
	Questions and Problems.....	481
	Background Reading.....	482
Chapter 12	Spectroscopy Tools and Techniques.....	489
12.1	Introduction.....	489
12.2	Guiding Principles.....	489
12.3	UV-Vis Absorbance Spectroscopy.....	490
12.4	Fluorescence Spectroscopy.....	493
12.4.1	Instrumentation.....	493
12.4.2	Caveats and Sources of Error.....	496
12.4.3	Quenching.....	497
12.4.4	Anisotropy.....	500
12.4.5	Energy Transfer.....	503
12.5	Time-Resolved Emission.....	508
12.6	Time-Resolved Absorption.....	511
12.7	Infrared Spectroscopy.....	513
12.7.1	Steady-State Mid-Infrared Spectroscopy.....	513
12.7.2	Time-Resolved IR Spectroscopy.....	517
12.8	Nuclear Magnetic Resonance.....	519
12.8.1	Introduction.....	519
12.8.2	Example: Examining Quantum Dot Surfaces with Liquid-Phase NMR.....	521
12.8.3	Solid-State NMR.....	523
12.8.4	Pulse Techniques and MRI.....	524
12.8.5	Paramagnetic Nanoparticles as MR Contrast Agents.....	526
12.8.6	NMR as an Emerging Technique in Structural Biology.....	530
12.9	Electron Paramagnetic Resonance Spectroscopy.....	530
12.9.1	Basic Principles.....	530
12.9.2	Spin Probes and Spin Traps.....	533
12.9.3	Instrumentation.....	536
12.10	X-Ray Spectroscopy.....	540

12.11 Example Experiment: Characterization of CdSe/ ZnS Nanoparticle Bioconjugate Using UV-Vis, Fluorescence Emission, Time-Resolved Emission, FTIR, and EPR Spectroscopy	545
12.11.1 UV-Vis and Fluorescence Emission	545
12.11.2 FTIR	546
12.11.3 TCSPC	547
12.11.4 EPR	548
12.12 Final Comments	549
Questions and Problems	550
Background Reading	551
Appendix	567
A.1 Common Solutions	567
A.2 Microbial Growth Media	571
A.3 Agarose Gel Recipes	573
A.4 Protein Gel Recipes	574
A.5 Restriction Endonucleases	576
A.6 Common Nucleic Acid Modifying Enzymes	585
A.7 Fluorescent Dyes and Quenchers	586
A.8 Fluorescent Proteins	591
Glossary	593
Index	627
