 1 Phylogenetic Analyses and Morphological Innovations in Land Plants	 1
James A. Doyle	
1.1 Introduction	2
1.2 Basic innovations in cell structure and life cycle: aquatic streptophytes	4
1.3 Invasion of the land: "bryophytes"	9
1.4 Origin of vascular plants: the importance of fossils	11
1.5 Early innovations within vascular plants: leaves, roots, and heterospory	13
1.6 Innovations on the line to seed plants: "progymnosperms" and "seed ferns"	18
1.7 Innovations within seed plants, especially conifers	22
1.8 Origin of angiosperms and their innovations	26
1.9 Innovations within angiosperms: monocots and eudicots	33
Acknowledgments	36
References	36
 2 The Evolution of Body Form in Bryophytes	 51
Bernard Goffinet and William R. Buck	
2.1 Fundamental Bauplan of bryophytes	53
2.1.1 The apical meristem is unicellular and growth is modular	53
2.1.2 The architecture of the gametophyte varies within bryophytes	54
2.1.3 Bryophytes differ consistently in their sporophytes	54
2.2 Phylogenetic relationships of bryophytes	55
2.3 Evolution of plant form in liverworts	61
2.3.1 The gametophyte	61
2.3.2 The sporophyte	64
2.3.3 Evolutionary trends	65
2.4 Evolution of plant form in mosses	67
2.4.1 The gametophyte	67

2.4.2	The sporophyte	73
2.4.3	Evolutionary trends	76
2.5	Evolution of plant form in hornworts	78
2.5.1	The gametophyte	78
2.5.2	The sporophyte	80
2.5.3	Evolutionary trends	80
2.6	The ancestral developmental toolbox of land plants	80
	Acknowledgments	84
	References	84
3	The Morphology and Development of Lycophytes	91
	<i>Barbara A. Ambrose</i>	
3.1	Introduction	91
3.2	Vasculature	96
3.3	Shoot apical meristems	96
3.4	Sporophyte architecture	99
3.5	Microphylls	101
3.6	Sporangia	103
3.7	Roots	105
3.8	Structural enigmas	106
3.8.1	Ligules	106
3.8.2	Rhizophores	108
3.9	Conclusions	109
	Acknowledgments	110
	References	110
4	Evolutionary Morphology of Ferns (Monilophytes)	115
	<i>Harald Schneider</i>	
4.1	Introduction	115
4.2	Context of evolutionary plant morphology	117
4.2.1	Perspective 1: rapid radiation versus stasis in the evolution of fern body plans	120
4.2.2	Perspective 2: key structures and organs of fern body plans	123
4.2.3	Perspective 3: genomics and evo-devo of ferns	132
	Acknowledgments	134
	References	134
5	Gymnosperms	141
	<i>Dennis Wm. Stevenson</i>	
5.1	Introduction	141
5.2	Architecture	142
5.3	Shoots	144
5.4	Leaves	147

5.5	Roots	150
5.6	Seeds	152
5.7	Seedlings	153
5.8	Embryology	154
	References	159
6	Identifying Key Features in the Origin and Early Diversification of Angiosperms	163
	<i>Paula J. Rudall</i>	
6.1	Introduction: key features of flowering plants	163
6.2	Patterning of flowers and inflorescences	164
6.3	Eight extant lineages of flowering plants	167
6.4	Origin of the angiosperms: the phylogenetic framework	169
6.5	Resolving conflicting hypotheses of flower origin	170
6.6	Evolution of the perianth	174
6.7	Carpels, gynoecia, and organ fusion	174
6.8	Origins of floral diversity: deep-node characters and genome duplications	176
6.9	Contrasting floral ground plans	178
6.10	Iterative origins of floral symmetry patterns and floral novelties	179
6.11	Constraints and canalization in floral evolution	180
	Acknowledgments	181
	References	181
7	Genomics, Adaptation, and the Evolution of Plant Form	189
	<i>Kristen Shepard</i>	
7.1	Overview	189
7.2	The types of genetic variation present within species	191
7.3	From phenotype to genotype: map-based approaches to identifying adaptive genes	193
7.3.1	The genetic architecture of quantitative traits	193
7.3.2	Family-based mapping	193
7.3.3	Advantages and disadvantages of family-based QTL mapping	194
7.3.4	Population-based mapping	195
7.3.5	Advantages and disadvantages of population-based QTL mapping	196
7.3.6	Additional considerations in QTL mapping	196
7.3.7	Emerging approaches for detecting QTL	197
7.4	From genotype to phenotype: molecular population genetics and adaptive evolution	197
7.4.1	Overview of molecular population genetics	197
7.4.2	Signatures of selection on DNA sequences	198

7.4.3	Demographic factors can complicate inferences of selection	199
7.4.4	Gathering nucleotide sequence data	199
7.4.5	Interpreting the sequence data: summary statistics and tests of neutrality	200
7.4.6	Nucleotide diversity and divergence	201
7.4.7	Analysis of the site frequency spectrum: Tajima's D and similar tests	201
7.4.8	Analyses of linkage disequilibrium: haplotype-based tests	202
7.4.9	Comparing diversity to divergence: McDonald-Kreitman and HKA tests	202
7.4.10	Detecting local adaptation: population differentiation and reduced variability	203
7.5	Bringing it all together—the need for thorough testing of adaptive hypotheses	204
7.5.1	Techniques for testing the functional consequences of polymorphisms	204
7.5.2	Testing adaptive hypotheses	206
7.6	Case studies in molecular population genomic approaches to the evolution of plant form	207
7.6.1	Case study 1: Identifying novel components of developmental regulatory networks— <i>BREVIS RADIX</i> in <i>Arabidopsis</i> roots	207
7.6.2	Case study 2: Identifying potential targets of positive selection via a genomic scan in a nonmodel species—signatures of selection in sunflower SSRs	209
7.6.3	Case study 3: Microevolution of a small gene family—phytochromes in <i>Arabidopsis</i>	211
7.6.4	Phytochrome A	212
7.6.5	Phytochrome B	213
7.6.6	Phytochrome C	213
7.6.7	Case study 4: Combining association mapping and population genomics—the <i>Arabidopsis</i> flowering time network	215
7.7	Conclusion	219
	References	220
8	Comparative Evolutionary Genomics of Land Plants	227
	<i>Amy Litt</i>	
8.1	Evolution of nuclear genome size	229
8.1.1	Gene number	232
8.2	Whole genome duplications	233
8.2.1	Whole genome duplications in non-flowering plants	236

8.2.2	Whole genome duplications in angiosperms	237
8.2.3	Impact of whole genome duplications on plant evolution	240
8.3	Transposable elements	241
8.3.1	Retrotransposons	242
8.3.2	DNA elements	243
8.3.3	Transposable elements and genome size	244
8.3.4	Dynamics of TE amplification and removal	246
8.3.5	Distribution of transposable elements in plant genomes	248
8.3.6	Impact of transposable elements on genome structure	249
8.3.7	Impact on gene diversity, expression, and function	250
8.4	Gene family expansions	252
8.4.1	Land plant gene diversification	252
8.4.2	Angiosperm gene diversification	254
8.5	Tandem gene duplications	257
8.6	Fern and gymnosperm genomes	258
8.7	Arabidopsis genome	260
8.8	Domestication	261
8.9	Future directions	263
	References	265
9	Development and the Evolution of Plant Form	277
	<i>Barbara A. Ambrose and Cristina Ferrández</i>	
9.1	Introduction	277
9.1.1	A brief historical overview of evolutionary developmental biology	278
9.1.2	General concepts in evolutionary developmental biology	279
9.2	Plant evolutionary developmental biology	280
9.2.1	The evolution and development of the flower	281
9.2.2	The evolution and development of leaves	293
9.3	Future directions	301
9.3.1	Morphological features	301
9.3.2	Alternation of generations	301
9.3.3	Gametophytes	303
9.3.4	Sporangia and spores	304
9.3.5	Meristems	305
9.3.6	Development of model organisms	307
9.4	Conclusions	308
	References	308

10	Development in the Wild: Phenotypic Plasticity	321
	<i>Kathleen Donohue</i>	
10.1	Development in the wild is phenotypic plasticity	321
10.1.1	Why are some traits more plastic than others?	323
10.1.2	Manifestations of phenotypic plasticity in plants	324
10.2	Why are some traits more plastic than others? The evolution of phenotypic plasticity	327
10.2.1	The adaptive value of plasticity: scales of environmental variation	327
10.2.2	Genetic constraints on the evolution of plasticity	332
10.3	The genetic basis of phenotypic plasticity and genetic constraints on plasticity	332
10.3.1	Molecular mechanisms of phenotypic plasticity: gene-environment interactions	333
10.3.2	How does the molecular mechanism of plasticity translate to genetic constraints on plasticity?	341
10.4	Phenotypic plasticity and local adaptation	343
10.4.1	Plasticity, niche width, and ecological isolation	344
10.4.2	Phenotypic plasticity as an intermediate stage of specialization	345
10.4.3	Does plasticity prevent or promote divergence?	346
10.5	Conclusion	348
	References	349
11	The Evolution of Plant Form: a Summary Perspective	357
	<i>Michael Purugganan</i>	
	References	363
