

Contents

<i>Preface</i>	vii
1. Structure of Cell	1
Prokaryotic Organelles	
2. Chemical Evolution of Cell	5
Earliest History of Earth • RNA World Hypothesis • Support and Difficulties • Details of the RNA World • Implications of the RNA World • Environmental and Evolutionary Impact of Microbial Mats • Diversification of Eukaryotes • Multicellular Organisms and Sexual Reproduction • Emergence of Animals • Colonization of Land • Dinosaurs, Birds and Mammals • Abiogenesis • Conceptual History • Early Conditions • From Organic Molecules to Protocells • Other Models • Life's Handedness	
3. Catalysts of Cell	68
Enzyme Structure • Transport of Chemicals in a Cell • Water and Solute Movement • The Cell Membrane • Cells and Diffusion • Carrier-assisted Transport • Active and Passive Transport • Types of Transport Molecules	
4. Chemical Environment of Cell	83
Nucleic Acids • Proteins • Polysaccharides • Lipids • The Cell Membrane • Transport Across the Membrane • Primary Active Transport • Transport of Particles • Internal Membranes • Cellular Organelles and Their Membranes • The Endoplasmic Reticulum • Sorting of Products by Chemical Receptors • The Nucleus • Structural Organization of the Nucleus • Biological Solvent • Water • Ammonia as Biological Solvent • Pick a Proper Planet • Osmosis • pH • Mathematical Definition • Acid-base Homeostasis	
5. Human Chromosomes	133
Gene • Physical Definitions • DNA Replication and Inheritance • Mendelian Inheritance and Classical Genetics • Genome	

• Evolutionary Concept of a Gene • Gene Targeting and Implications • Noncoding DNA • Types of Noncoding DNA Sequences • Functions of Noncoding DNA • Noncoding DNA and Evolution • Transcription and Translation • Polymerase Chain Reaction • PCR Principles and Procedure • Application of PCR • Variations on the Basic PCR Technique • Interactions with Proteins • DNA-modifying Enzymes • Genetic Recombination • Uses in Technology • History of DNA Research • Ribonucleic Acid • Comparison with DNA • Types of RNA • Key Discoveries in RNA Biology • RNA Extraction • RNA Splicing • Splicing Pathways • Duplication of DNA • The Biochemical Reactions • DNA Replication is Semiconservative • Speed of Replication • Eukaryotes • Control of Replication • DNA Duplication: A Mechanism for 'Survival of the Fittest'

6. DNA Biochemistry 200

Properties • Chemical Modifications • Biological Functions • DNA Replication • DNA Polymerase • DNA Replication within the Cell • DNA-modifying Enzymes • Genetic Recombination • Evolution • DNA Microarray • Significance Analysis of Microarrays

7. Cell Signalling and Gene Transcription 233

Unicellular and Multicellular Organism Cell Signalling • Classification of Intercellular Communication • Gene Transcription • Major Steps • Transcription Factories • Designing Designs for Research • Minimizing Threats to Validity • Advances in Quasi-Experimentation • The Advantages of Multiple Perspectives • Evolution of the Concept of Validity • Development of Increasingly Complex Realistic Analytic Models • Analysis • Protein Tertiary Structure • Protein Quaternary Structure • Protein Folding • Protein Structure Prediction

Bibliography 275
