

Contents

1. Introduction	1
We explain why molecular biology is so important for anyone intending to live in the 21st century.	
2. Bacteria: The Molecular Biologist's Guinea Pigs	5
Breakthroughs in molecular biology came largely from studying bacteria.	
3. Basic Genetics	13
Describes inheritance and lays the foundation for understanding how genes are expressed.	
4. Required Reading: The Molecular Basis of Heredity	25
The structure of DNA, the molecule carrying the cell's genetic information.	
5. Duplicating the DNA: Replication	35
How genes made of DNA duplicate themselves as cells multiply is explained.	
6. Getting the Message Out: Transcription of Genes to Produce Messenger RNA	47
Information stored in DNA is transferred to RNA which starts on its journey as a message carrying information to the rest of the cell.	
7. Proteins: The Buck Stops Here	63
The message brought by RNA is decoded by a special apparatus which makes protein.	
8. Sex Among the Low-Lifes and Its Exploitation by Molecular Biologists: Gene Transfer in Bacteria	83
This chapter explains how bacteria replicate their DNA and how molecular biologists exploit bacteria in a laboratory setting.	
9. Messing about with DNA	95
The most basic techniques used by molecular biologists in handling DNA are explained.	
10. Products from Biotechnology	113
Examples are given showing how molecular biology has been used to produce useful products for both profit and fun.	
11. Genetic Organization in Higher Organisms	131
Bacteria are more primitive than the rest of us and this chapter explains how more advanced creatures accomplish their goals of gene expression and protein synthesis.	
12. Mutations: Things That Go Bump in the Night	153
Explains how a change in the genetic code affects an organism for better or worse.	
13. Inherited Human Disease	173
All disease, except trauma, has a genetic basis. Interesting examples are described here.	
14. Cancer and Aging	191
Cancer and aging are ultimately of genetic origin. The mechanisms of both are illustrated.	

15. Down on the Farm: Transgenic Plants and Animals	217
Biotechnology has been used to produce useful products for agriculture.	
16. Just Do It! Techniques of Molecular Biology	237
The molecular biologist has a whole armory of techniques that are described here.	
17. PCR: The Polymerase Chain Reaction and Its Many Uses	271
This ultrasensitive technique is used to detect and amplify specific regions of DNA.	
18. Whodunit? Forensic Medicine and Molecular Biology	287
How DNA technology is used to establish identity is described here.	
19. Gene Creatures, Part I: Viruses, Viroids and Plasmids	299
Don't ignore these creatures. They use their genes to manipulate your genetic machinery.	
20. Gene Creatures, Part II: Jumping Genes and Junk DNA	317
Some genes can move around and may create large amounts of DNA that has no purpose.	
21. Biological Warfare	335
Some creatures use their genetic machinery to wage war on other creatures.	
22. The Molecular Defense Initiative: Your Immune System at Work	361
A few genes can produce an enormous variety of antibodies that are used to fight invaders.	
23. Genomics and DNA Sequencing	387
We have now been sequenced but do we understand ourselves?	
24. Molecular Evolution: Memories of "The Way We Were"	401
Fossils may be impressive but evolution can best be understood by looking at changes in DNA.	
25. RNA: The Final Frontier	431
New discoveries reveal that RNA can do almost anything.	
26. Classification: Biology for the Neurotic and the Obsessive-Compulsive	439
Classification of organisms into one group or another has its ultimate basis in DNA similarities.	
27. A Brief History of Molecular Biology	451
For lovers of history, some of the most famous experiments with genes and DNA are described.	
28. What Was Said-What Was Meant: Understanding a Molecular Biology Seminar	457
Making a technical seminar simple; this is your final exam.	
29. DNA Gets Personal	465
Personal genomics from human ancestry to obesity genes.	
30. Brush Up Your Chemistry	475
The basic chemistry needed to understand molecular biology.
